# Installing Pedestal Options

*This chapter describes the basic considerations for installing options in high-availability pedestals and the procedures common to all option installations. These common procedures are **prerequisites** for installing options.*

## 1.1 Installation Guide Overview

This chapter describes the considerations, recommended installation sequence, and preliminary procedures for installing options in a high-availability pedestal, commonly referred to as the “pedestal.” You can install the options individually, or several at the same time. It is not possible to identify all the possible option installation combinations as this is a function of when you purchase the options. Each chapter describes the procedures for installing a single option. When installing multiple options, it may be necessary to combine procedures to simplify and expedite the installation process.

Each installation procedure is identified clearly and each installation process is numbered. For clarity, the associated illustrations use the same numbers to identify component locations and the installation sequence.

## 1.2 Installing Multiple Options

You can install options in any sequence. However, to simplify the process and thereby reduce the time required, Digital recommends that when you are installing *multiple options* at the same time, you install them in the following sequence:

Preferred Installation Sequence	Option Installation Instructions
1. Install the pedestal base (SH02D).	See the <i>HA720W High-Availability Pedestal OEM Product Description</i> .
2. Install the redundant power option (SHGZ4).	See Chapter 2.
3. Install the dual bus option (SH02A).	See Chapter 3.
4. Install the SCSI bus converter option (SHZ36).	See Chapter 4.
5. Install the EMU option (SH02B).	See Chapter 5.
6. Install the 5.25-inch storage device option (SH02C)	See Chapter 6.
7. Install the storage controller options (SHZ66 or SHZ67).	See Chapter 7.
8. Install the storage controller dual pedestal option (SH02E).	See Chapter 8.

### 1.3 Installing High-Availability Pedestal Options

Due to possible configuration conflicts or the complexity of the installation process, Digital recommends that you do not install the following combination of options in the same pedestal:

Do not install this option...		with these options...	
Description	Option	Description	Option
5.25-Inch Storage Device	N/A	Storage Controller with 16 MB Cache Storage Controller with 4 MB Cache	SHZ67 SHZ66
Dual Bus	SH02A	Dual Pedestal Storage Controller	SH02E
Dual Pedestal Storage Controller	SH02E	Dual Bus	SH02A
Environmental Monitor Unit	SH02B		
Pedestal Base	SH02D		
Redundant Power Supply	SHGZ4		
SCSI Bus Converter	SHZ36		
Storage Controller with 16 MB Cache	SHZ67	5.25-Inch Storage Device	
Storage Controller with 4 MB Cache	SHZ66	5.25-Inch Storage Device	
	No restrictions.		

You can install the pedestal option at any time, but some options require that you also install other options. Therefore, you must install *all* the related options to ensure proper operation. Installing a single option is a relatively straight-forward and simple procedure.

The information available in Table 1–1 includes the following:

- The high-availability pedestals options.
- The combination of options *required* to install an option in each model pedestal..

**Table 1–1 Pedestal Options**

To install this option ...		in these pedestals, you must also install the following options...

Dual Bus	SH02A

- Option standard on this pedestal.
- No other option required.
- Option cannot be installed.

## 1.4 How to Remove the Side Cover

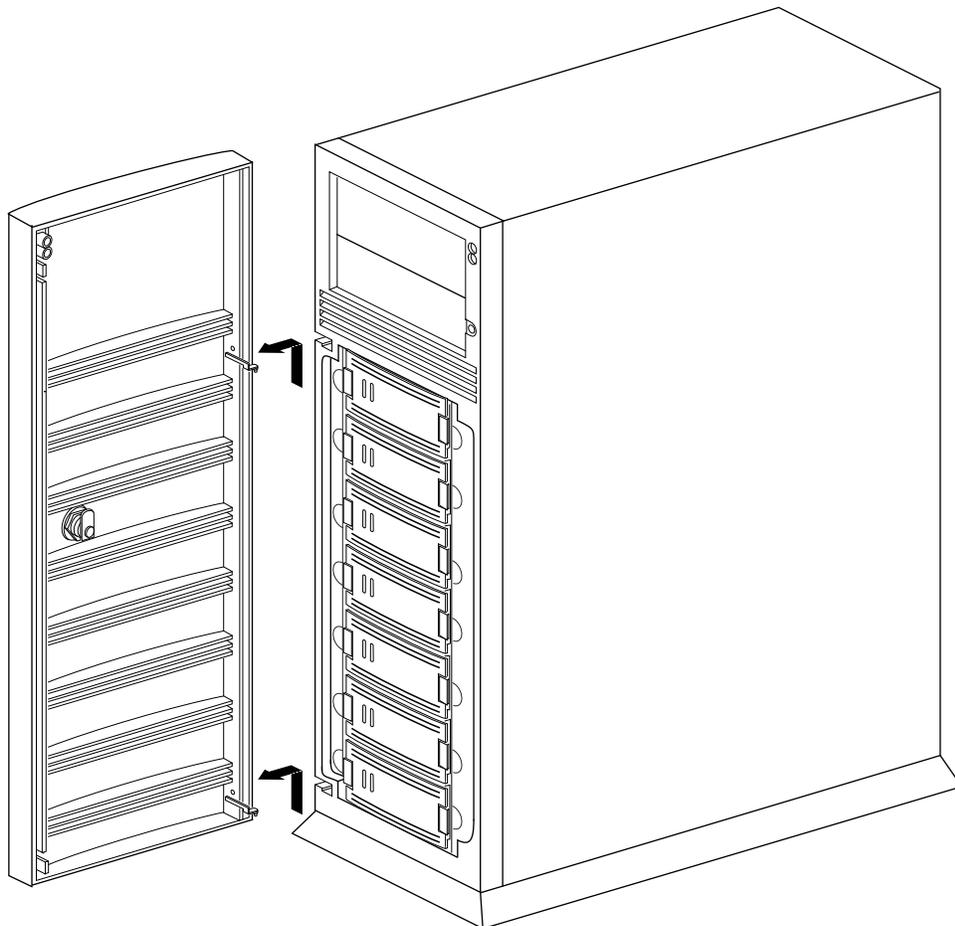

You must remove the left side cover to configure the pedestal, move internal SCSI cables, or install options. This requires you to complete the following procedure:

1. Turn off the power to both the controller and the pedestal.
2. Disconnect the pedestal power cord.

### **WARNING**

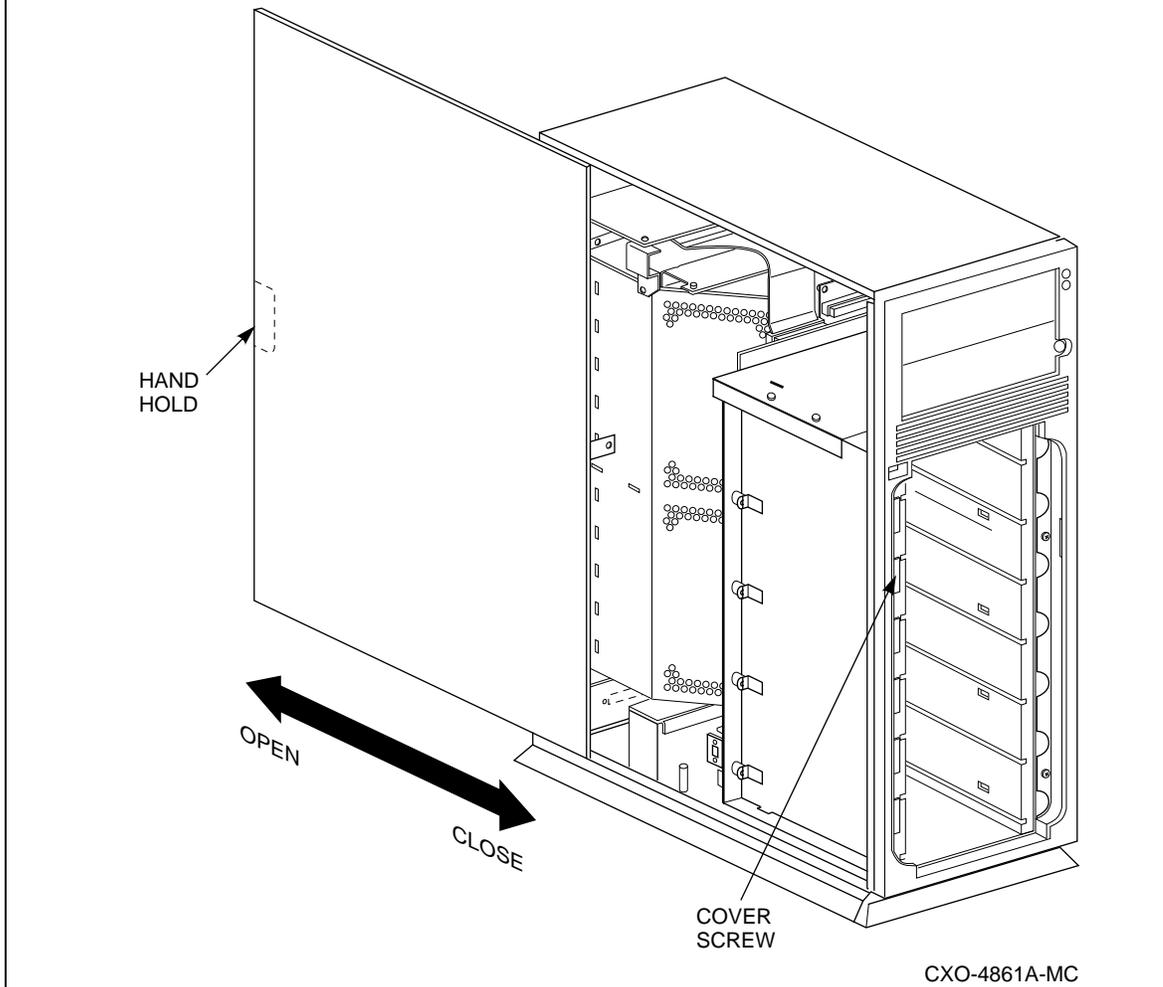

**Dangerous voltages are present within the pedestal. To prevent electrical shock, always turn the off pedestal and disconnect the pedestal power cords before removing the side cover.**

3. Disconnect the external SCSI bus cables.
4. Open the door to a 90° angle in relation to the pedestal as shown.
5. Carefully lift up on the door until the hinge pins are against the top of mounting holes.
6. Pull the door straight out until the hinge pins clear the bezel.

CXO-5030A-MC

7. Remove the left side cover screw.
8. Grasp the side cover rear hand hold and slide the cover to the rear until you can lift the cover up and remove it.

**CAUTION**

When the pedestal side cover is open, there is no air flow through the SBBs. Therefore, never operate the pedestal with the side cover open.

## 1.5 How to Test the Pedestal

After you have completed installing an option or servicing the pedestal, complete the following procedure to replace the side cover and test the pedestal for proper operation:

### **CAUTION**

To maintain proper cooling, always replace the side cover before applying power.

1. Align the side cover with enclosure and insert the top edge of the cover into the pedestal.
2. Seat the bottom edge of the cover in the pedestal, and while pushing in on the cover, slide it forward until it fully seats.
3. Install the side cover mounting screw.

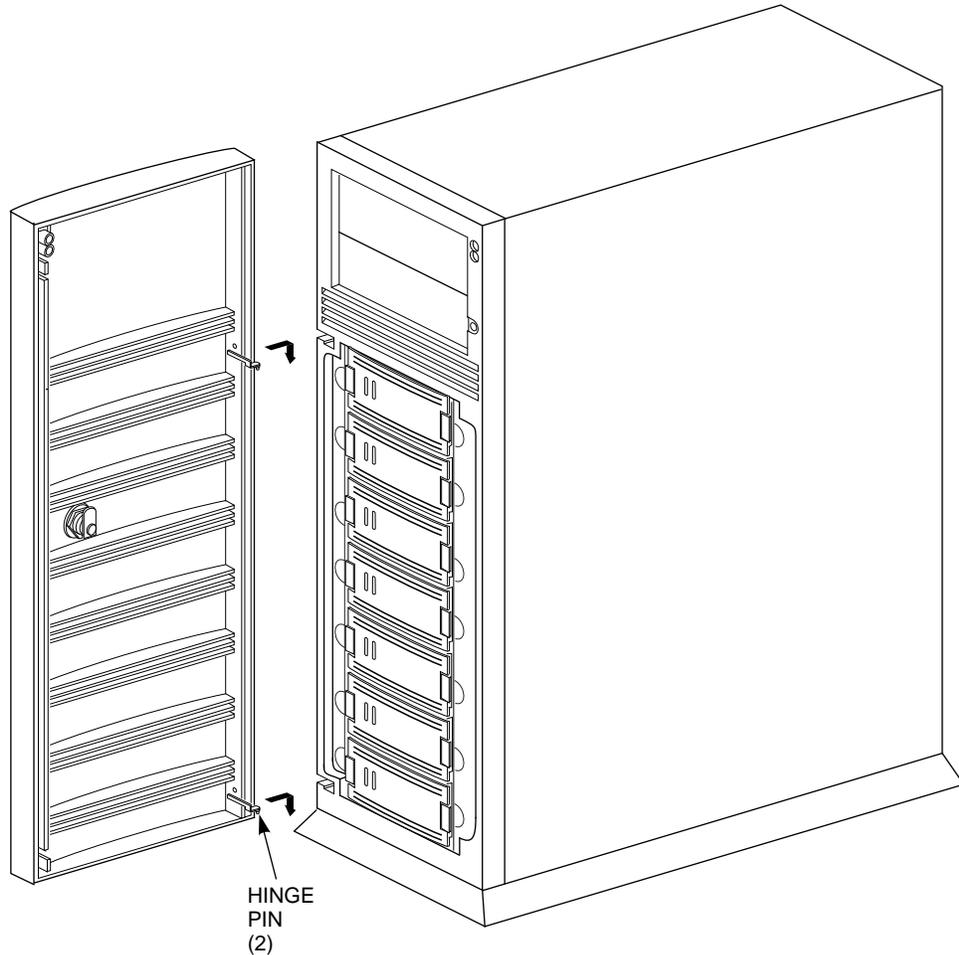

CXO-4861A-MC

4. Connect the external SCSI bus cables.
5. Connect the pedestal power cords.
6. Turn on the pedestal.
7. Observe the LEDs on the pedestal and the devices and check for proper operation.

## 1.6 How to Mount the Door

Complete the following procedure to mount the door:

1. Position the door at a 90° angle in relation to the pedestal.
2. Align the hinges with *both* the top and the left side of the mounting holes.
3. Insert the hinges into the bezel until they are the rear of the mounting holes.
4. Gently lower the door until the hinge pins are fully seated in the bezel.

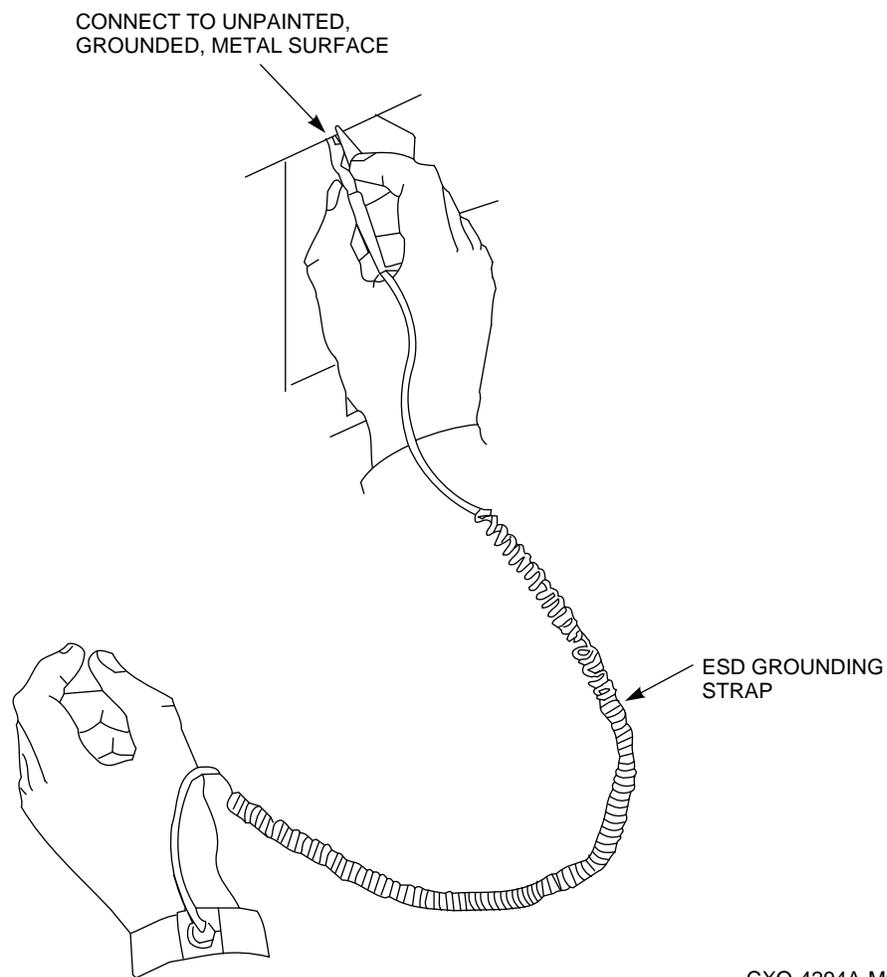

CXO-4554A-MC

## 1.7 How to Provide ESD Protection

Electrostatic discharge (ESD) can damage storage devices. To prevent this, you must take the following precautions:

- Either place an ESD mat on the work surface before starting the procedures and then place the components on the mat during assembly,  
or  
Wear an ESD wrist strap whenever you handle any of the electronic components (see Figure 1–1).
- Do not touch the device connectors.

**Figure 1–1 Using the ESD Strap**

# Installing a Redundant Power Supply

*This chapter describes the procedure for installing the redundant power supply option in a high-availability pedestal.*

---

**NOTE**

This option is a prerequisite for installing the EMU, the 5.25-inch storage devices, and the storage controller options.

---

You can install options in any sequence. However, to simplify the process and thereby reduce the time required, Digital recommends that when you are installing *multiple options* at the same time, you install them in the following sequence:

1. Install the pedestal base (SH02D).
- 2. Install the redundant power option (SHGZ4).**
3. Install the dual bus option (SH02A).
4. Install the SCSI bus converter option (SHZ36).
5. Install the EMU option (SH02B).
6. Install the 5.25-inch storage device option (SH02C).
7. Install the storage controller options (SHZ66 or SHZ67).
8. Install the storage controller dual pedestal option (SH02E).

## 2.1 How to Prepare for the Installation

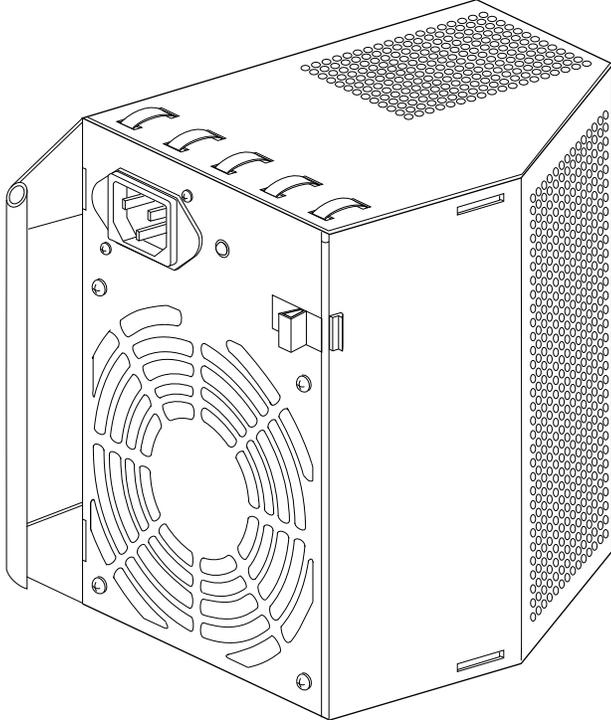

Installing this option requires you to do the following:

1. Review this chapter to become familiar with the installation procedures and the components.
2. Complete the preliminary procedures described in Chapter 1, “Installing the Pedestal Options.”
3. Set the power module backplane and the EMU jumpers.
4. Install the power supply
5. Install the side cover.
6. Test the pedestal for proper operation.

## 2.2 What You Need to Complete the Installation

## 2.3 How to Install the Redundant Power Supply

### NOTE

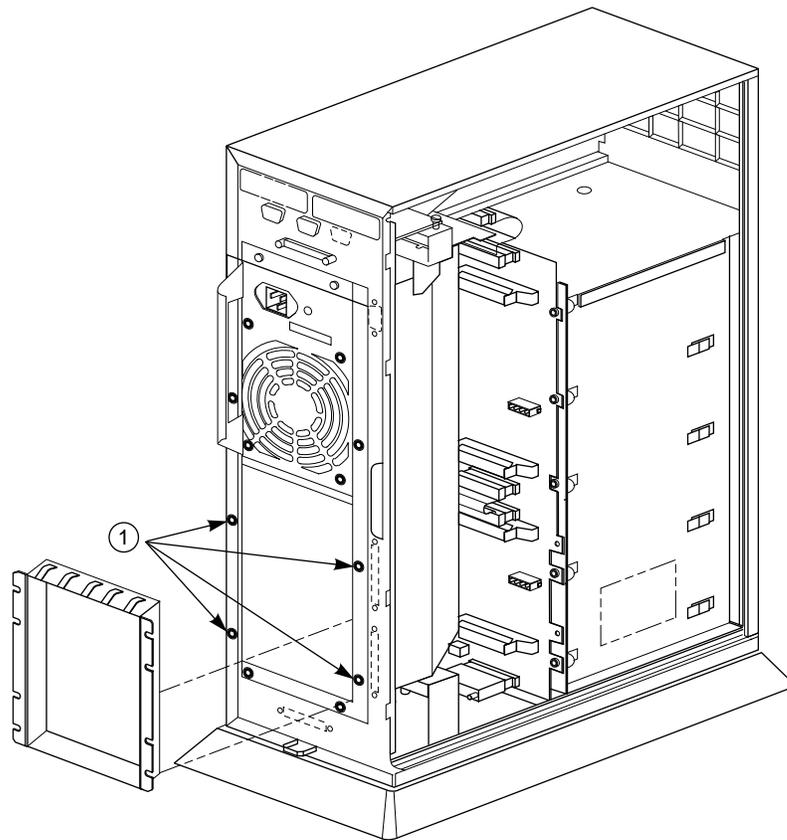

Each installation process is numbered. For clarity, the associated illustrations use the same numbers to identify component locations and the installation sequence.

After you turn off the power and remove the side cover as described in Section 1.4, complete the following procedure to install the redundant power supply option:

### NOTE

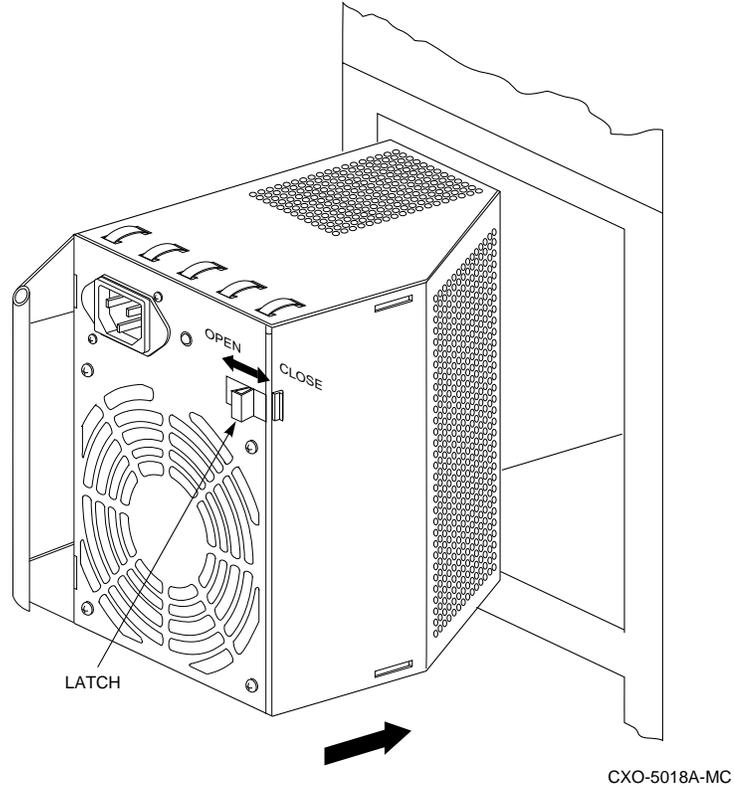

You do not need to disconnect the SCSI bus cables..

1. Remove the four screws from the power supply blank panel. Remove the blank panel. Insert the four screws into pedestal rear panel and tighten.

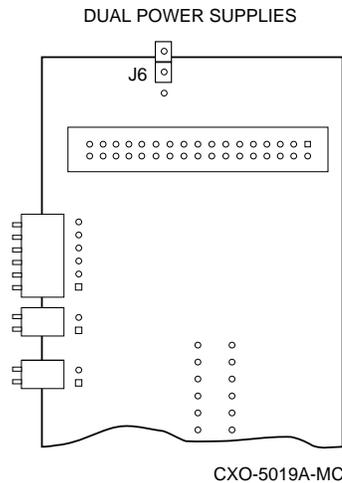

CXO-5031A-MC

2. Align the redundant power supply with power supply module connector. Slide the power supply in and firmly seat it. Be sure that the latch engages.

3. On the power module backplane, place the jumper on only one pin of connector J6 (the dual power supply configuration).

4. Test the pedestal for proper operation by completing the procedure in Section 1.5.  
THIS COMPLETES THE REDUNDANT POWER SUPPLY OPTION INSTALLATION PROCEDURE.

## Installing a Dual Bus

---

*This chapter describes the procedure for installing the dual bus option in a high-availability pedestal.*

The pedestal can operate as either a single SCSI bus (up to 9 devices) or a dual SCSI bus (a 6 device bus and a 3 device bus). Converting from a single bus to a dual bus is simply a matter of installing the option cables and the terminator. Operating in the dual bus mode enables you to use different controllers with each bus. Converting from a dual bus to a single bus involves disconnecting the dual bus cables from the backplane and installing the single bus jumper cable.

### **CAUTION**

---

When converting from a *dual bus* configuration to a *single bus* configuration, **do not** remove the dual bus cable connectors from the rear panel. Removing these connectors will disrupt the air flow through the pedestal and can cause overheating.

---

The dual bus configuration provides the capability of using two external or internal SCSI bus controllers to control devices in a pedestal. You can “split” the SCSI bus backplane into an upper bus (Bus “A”) of four devices and a lower bus (Bus “B”) of three devices. Depending upon the controller, the bus width, and the bus speed, you may have the option of extending either bus to another pedestal. With the 5.25-inch storage device mounting option, you can install two half-height 5.25-inch storage devices. This expands the capacity of the upper bus to six devices. The total capacity of the pedestal is now nine devices. The only configuration restriction is that the 5.25-inch devices must have unique, 8-bit SCSI bus device addresses.

When you implement this option there are multiple possible configurations. This chapter discusses only the basic four device bus and three device bus configuration.

You can install options in any sequence. However, to simplify the process and thereby reduce the time required, Digital recommends that when you are installing *multiple options* at the same time, you install them in the following sequence:

1. Install the pedestal base (SH02D).
2. Install the redundant power option (SHGZ4).
3. **Install the dual bus option (SH02A).**
4. Install the SCSI bus converter option (SHZ36).
5. Install the EMU option (SH02B).
6. Install the 5.25-inch storage device option (SH02C).
7. Install the storage controller options (SHZ66 or SHZ67).
8. Install the storage controller dual pedestal option (SH02E).

### 3.1 How to Prepare for the Installation

Installing the dual bus option requires you to do the following:

1. Review this chapter to become familiar with the installation procedures and the components.
2. Determine the preferred configuration and the maximum length of each SCSI bus as described in the “Configuring a Pedestal” chapter in the *HA720W High-Availability Pedestal OEM Product Specification*.

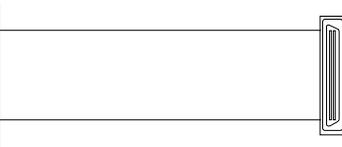

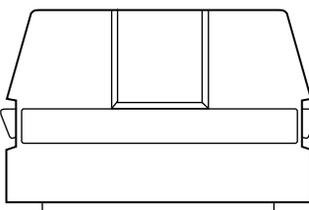

The maximum length of each bus determines whether you can extend the bus to another pedestal, that is, “daisy chain” the pedestals.

3. Check each device address to be sure that every device *on the same bus* has a unique SCSI bus address.
4. Complete the preliminary procedures described in Chapter 1, “Installing the Pedestal Options.”
5. Install the internal cables and terminators
6. Install the side cover.
7. Test the pedestal for proper operation.

### 3.2 What You Need to Complete the Installation

Table 3–1 describes the materials you need to install this option.

### 3.3 How to Install the Dual Bus Option

**NOTE**

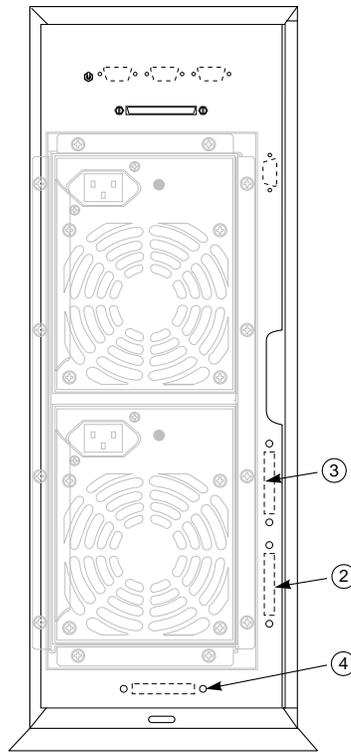

Each installation process is numbered. For clarity, the associated illustrations use the same numbers to identify component locations and the installation sequence.

After you turn off the power, disconnect the SCSI cables, and remove the side cover as described in Section 1.4, complete the following procedure to connect the dual bus cables:

1. Remove the jumper cable between backplane connectors J11 and J16.

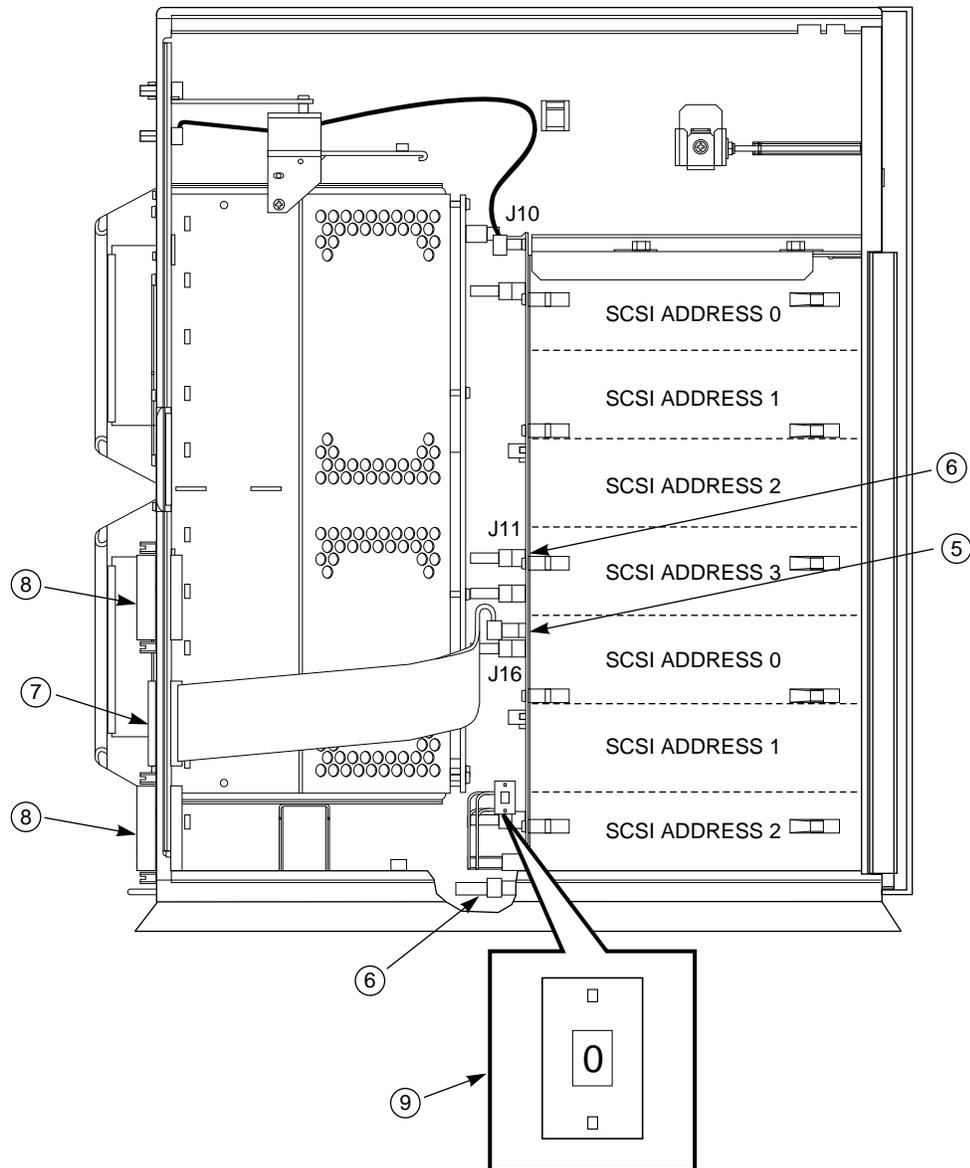

2. Remove the Bus "B" input connector "knockout" panel from the rear panel.
3. When Bus "A" is not terminated on the backplane, remove the Bus "A" output connector knockout from the rear panel
4. When Bus "B" is not terminated on the backplane, remove the Bus "B" output connector knockout from the rear panel

CXO-5034A-MC

5. Connect the Bus “B” input cable to backplane connector J16.
6. Based on your configuration connect either terminators or I/O cables to backplane connectors J11 (Bus “A” output) and J17 (Bus “B” output).
7. Mount the Bus “B” input cable connector on the rear panel.
8. For each bus that *is not terminated on the backplane*, mount an output cable connector on the rear panel.
9. Set the configuration address switch to address **0**.

## 5.4 How to Connect SHELF\_OK to an External SCSI Controller

The EMU SHELF\_OK signal can be processed by some *external* SCSI bus controllers. When the controller can process the signal, you will need to install the SHELF\_OK cables. Two of these cables are supplied with each pedestal.

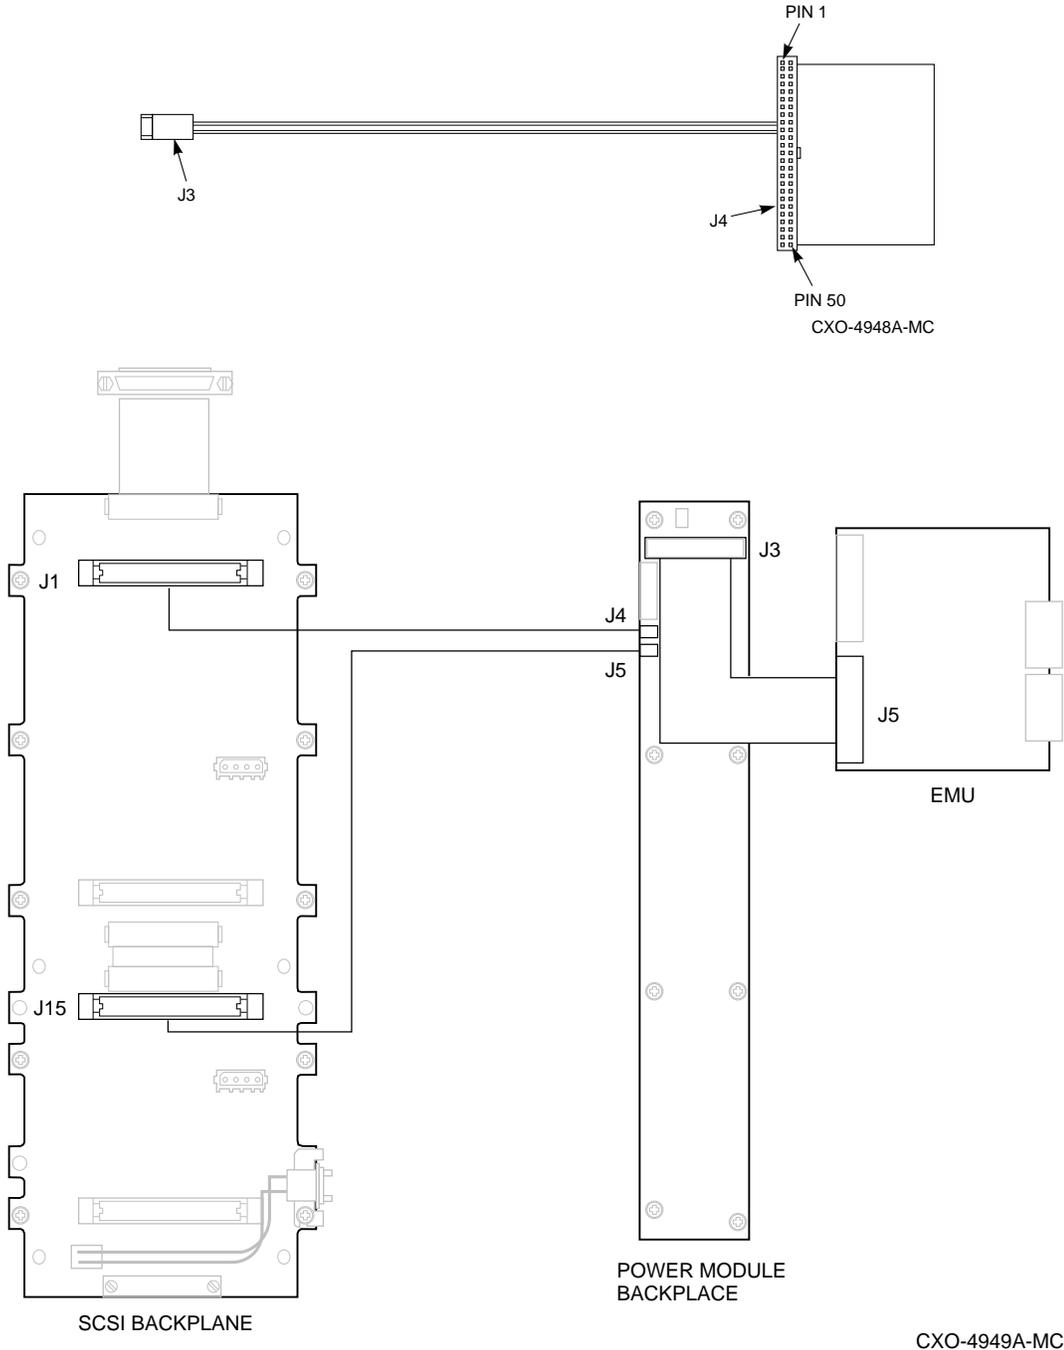

Complete the following procedure to route the SHELF\_OK signal to a SCSI bus controller:

1. Is the SCSI bus backplane configured as single bus (jumper cable installed between connectors J11 and J16)?
  - YES Go to Step 2
  - NO: Go to Step 3.
2. Install the SHELF\_OK jumper between either J4 or J5 on the power module backplane and one of the 50-pin connectors on the SCSI bus backplane.

THIS COMPLETES THE SINGLE BUS SHELF\_OK INSTALLATION PROCEDURE.

3. Install a SHELF\_OK jumper cable between the power module backplane and the SCSI bus backplane as shown.
4. Install the other SHELF\_OK jumper cable between the power module backplane and the SCSI bus backplane.

THIS COMPLETES THE DUAL BUS SHELF\_OK INSTALLATION PROCEDURE.

# Installing a 5.25-Inch Storage Device

---

*This chapter describes the procedure for installing a user-supplied 5.25-inch storage device using the 5.25-inch device mounting option.*

You can install a *user-supplied* half-height or full-height 5.25-inch storage device in a high-availability pedestal using the 5.25-inch device mounting option. Digital recommends installing this option only in pedestals with an EMU and redundant power supplies. The procedures in this chapter are based on this configuration.

You can install options in any sequence. However, to simplify the process and thereby reduce the time required, Digital recommends that when you are installing *multiple options* at the same time, you install them in the following sequence:

1. Install the pedestal base (SH02D).
2. Install the redundant power option (SHGZ4).
3. Install the dual bus option (SH02A).
4. Install the SCSI bus converter option (SHZ36).
5. Install the EMU option (SH02B).
- 6. Install the 5.25-inch storage device option (SH02C).**
7. Install the storage controller options (SHZ66 or SHZ67).
8. Install the storage controller dual pedestal option (SH02E).

## 6.1 How to Prepare for the Installation

Installing this option requires you to do the following:

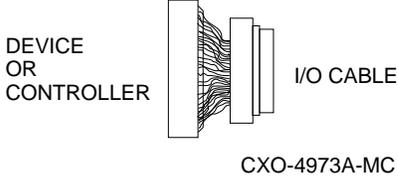

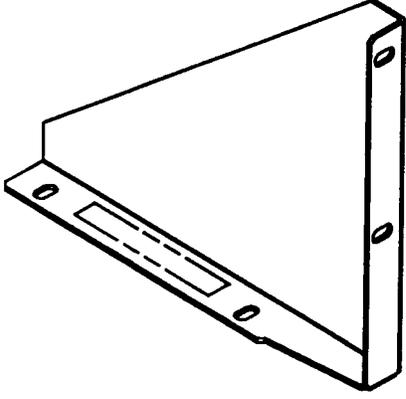

1. Review this chapter to become familiar with the installation procedures and the option materials.
2. Read the storage device publications so that you are familiar with the device and its components. Pay particular attention to:
  - Procedures for disabling the storage device internal SCSI bus termination.
  - Procedures for setting the storage device internal SCSI bus address.
3. Be sure that you have all the option materials listed in Section 6.2.
4. Disable the storage device internal SCSI bus termination as described in the device operator's manual or user's guide.
5. Set the storage device SCSI bus address as described in the device operator's manual or user's guide and Section 6.3.
6. Remove the device filler panels from the pedestal and the modular carrier (see Section 6.4).
7. Mount the storage device in the modular carrier and connect the cables (see Section 6.6).
8. Install the modular carrier and the angle bracket in the pedestal (see Section 6.7).
9. Test the pedestal for proper operation.

### 6.3 How to Set the Device SCSI Address

See the “Configuring a Pedestal” chapter in the *HA720W High-Availability Pedestal OEM Product Specification* and select a *valid* device address for each device. *All devices on a single SCSI bus must have a unique address.* Set the device address per the manufacturer's instructions.

#### **CAUTION**

The only valid SCSI device addresses for the *8-bit* storage devices are 0 through 6.

When you set the device address, be sure that to disable the device internal SCSI bus termination.

## 6.4 How to Remove the Pedestal Filler Panel

### NOTE

There are two device filler panels: one is in the pedestal, and one is in the modular carrier. The pedestal panel is always removed. You remove the modular carrier device filler panel when installing either a full-height device or a half-height device in the lower position. When installing a single, half-height device, install the filler panel in the unused location to control the air flow in the pedestal.

### NOTE

Each installation process is numbered. For clarity, the associated illustrations use the same numbers to identify component locations and the installation sequence.

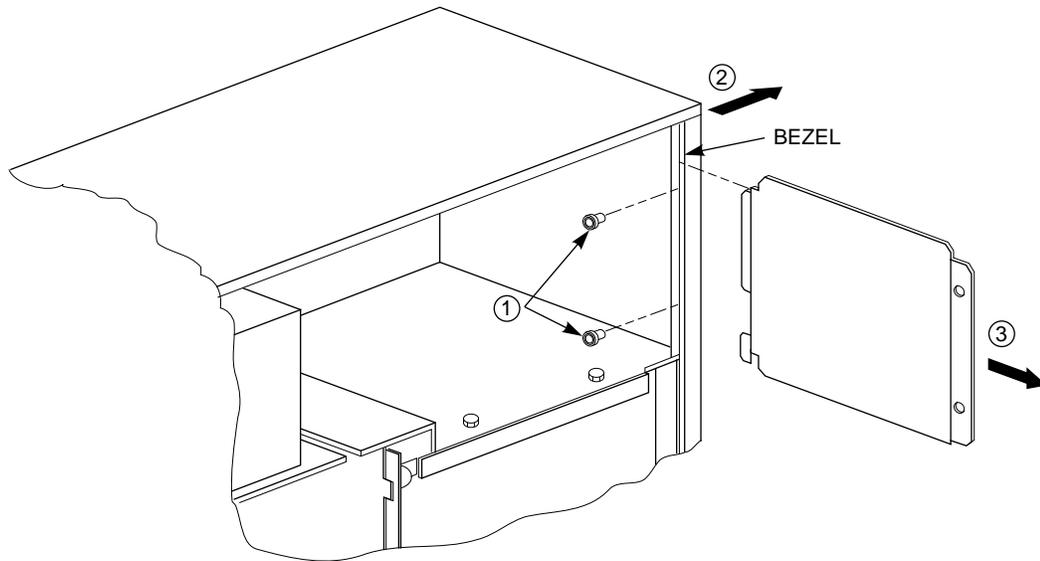

After you turn off the power, disconnect the SCSI cables and remove the side cover as described in Section 1.4, complete the following procedure to remove the filler panels:

1. Remove the two mounting screws that secure the bezel.

### NOTE

These screws are used to mount the angle bracket (see Section 6.7).

2. Gently push the bezel forward.
3. Pull out the filler panel.

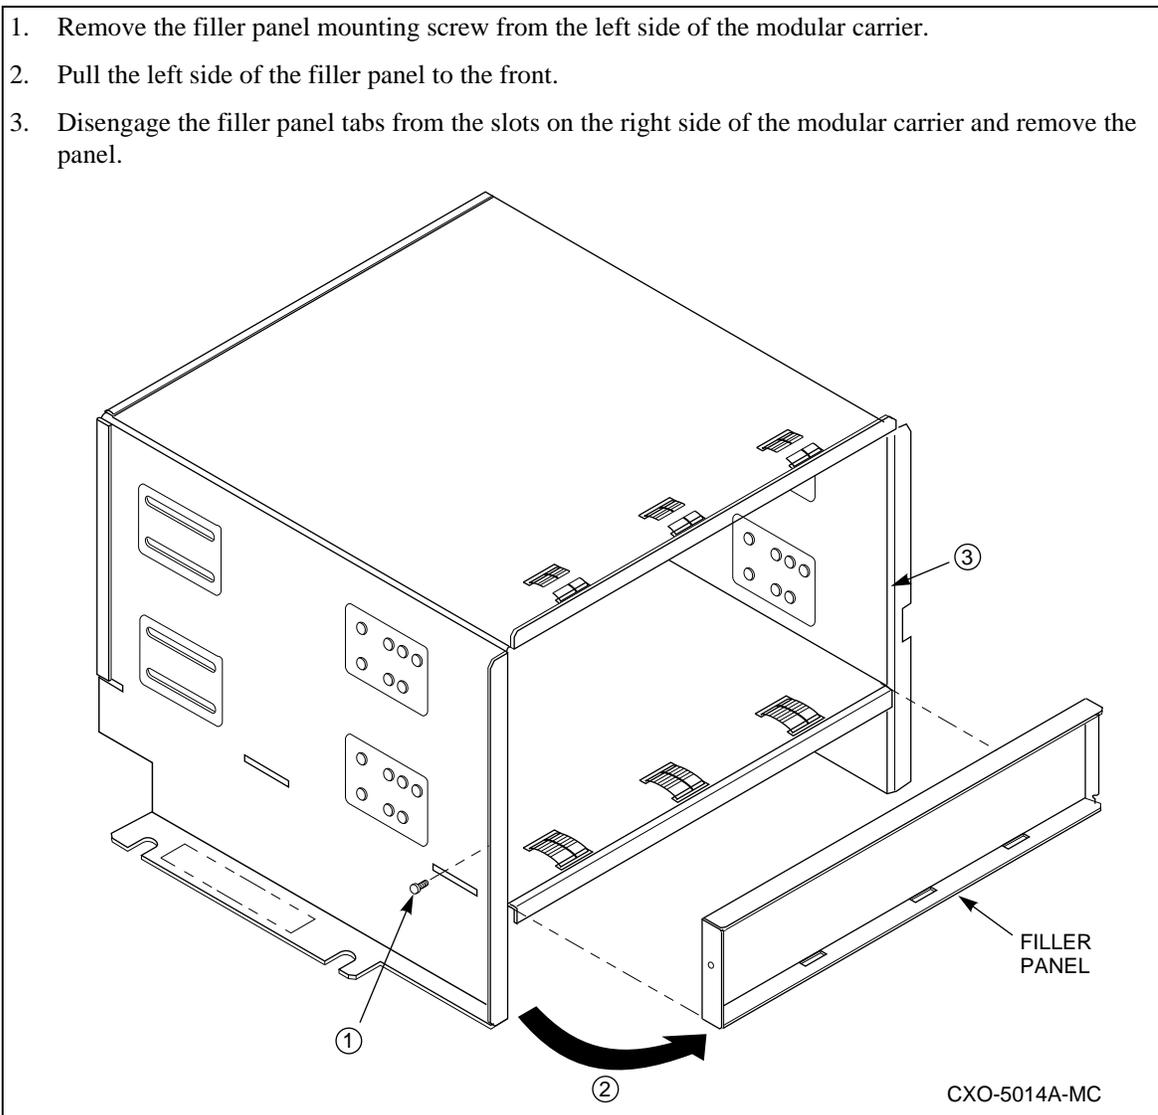

CXO-5013A-MC

## 6.5 How to Remove the Modular Carrier Filler Panel

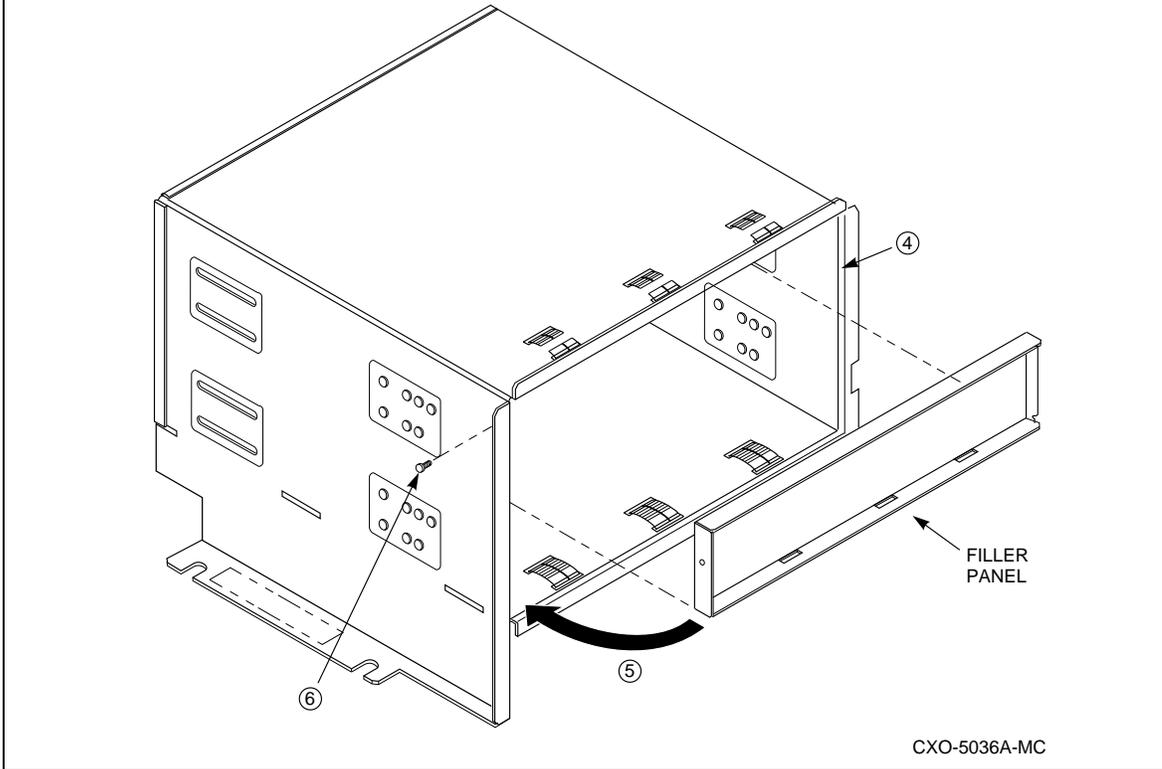

The modular carrier device filler panel is factory installed. When you install either a full-height device or a half-height device in the lower position, you must remove the panel by completing the following procedure:

### CAUTION

When you install a single half-height device, you must install the modular carrier device filler panel in the unused position to maintain air flow through the device and the power supply.

4. To install a filler panel in the upper position, insert the filler panel tabs in the slots at the top of the modular carrier.
5. Push the left side of the filler panel in until it is seated.
6. Install the mounting screw.

## 6.6 How to Mount a Storage Device

The modular carrier has multiple mounting holes and two mounting slots. The device form factor (half-height or full height) as well as the specific device determines the mounting holes used. The general configuration rules are:

- A single half-height device is mounted in the top slot.
- A full height device is mounted in the bottom slot.

Complete the following procedure to mount the device in the modular carrier:

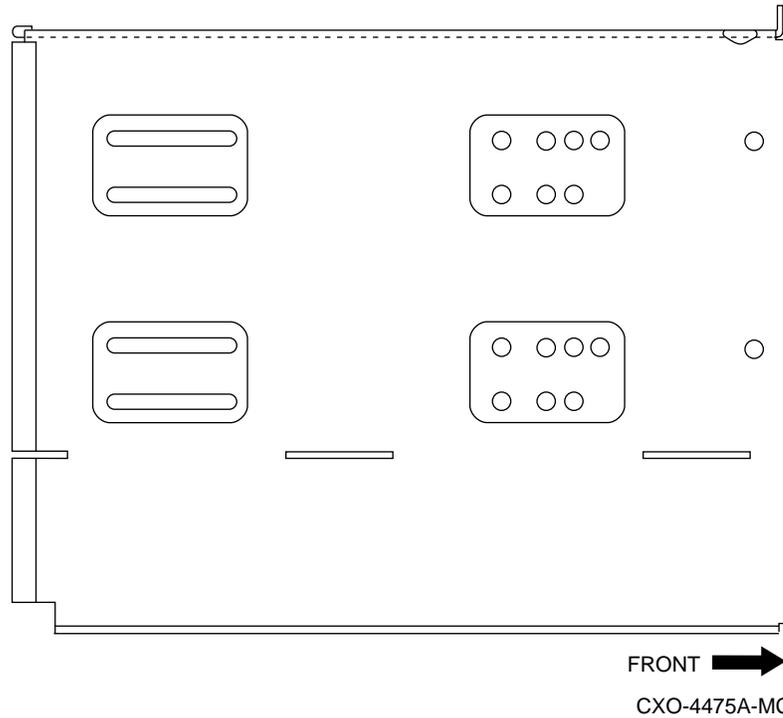

### **CAUTION**

Electrostatic discharge (ESD) can damage storage devices. To prevent this, you must take the following precautions:

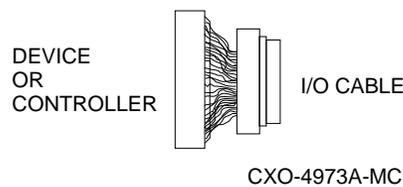

- Either place an ESD mat on the work surface before starting the procedures and then place the components on the mat during assembly,  
or  
Wear an ESD wrist strap whenever you handle any of the electronic components (see Section 0).

- Do not touch the device connectors.

1. Determine the mounting holes to be used by inserting the device into the carrier from the front and moving it so that the slots in the rear and the mounting holes in the front align with the device mounting holes.
2. Insert the device mounting screws and tighten them.

3. Connect a 68-pin to 50-pin adapter cable to the each device 50-pin connector.

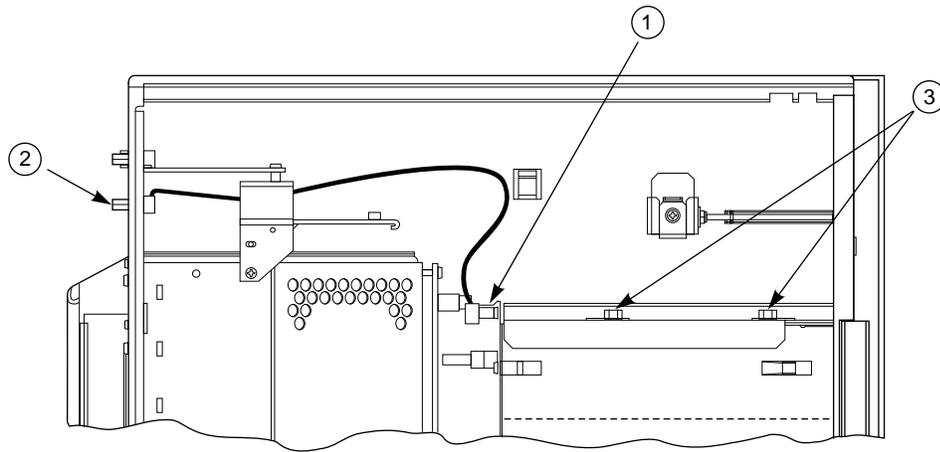

**CAUTION**

The only *compatible* 68-pin to 50-pin storage device adapter cables are part number 12-04009-02. The similar appearing adapter cable, part number 12-04009-01, is *not storage device compatible* and can be used only with storage controllers.

## 6.7 How to Install the Modular Carrier

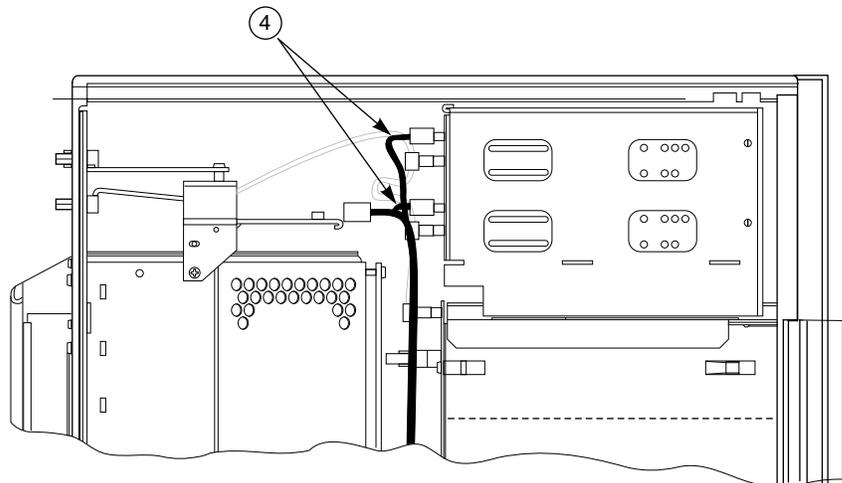

Complete the following procedure to install the modular carrier in the pedestal and to connect the cables:

1. Disconnect the 68-conductor I/O cable from the pedestal SCSI bus backplane.
2. On the rear panel, remove the 68-conductor I/O cable connector mounting hardware. Remove the I/O cable.  
**NOTE:**  
Save the cable and mounting hardware.
3. Remove the two mounting screws from the pedestal.

CXO-4989A-MC

4. Set the modular carrier in the pedestal and connect a 4-pin dc power cable connector to each storage device.

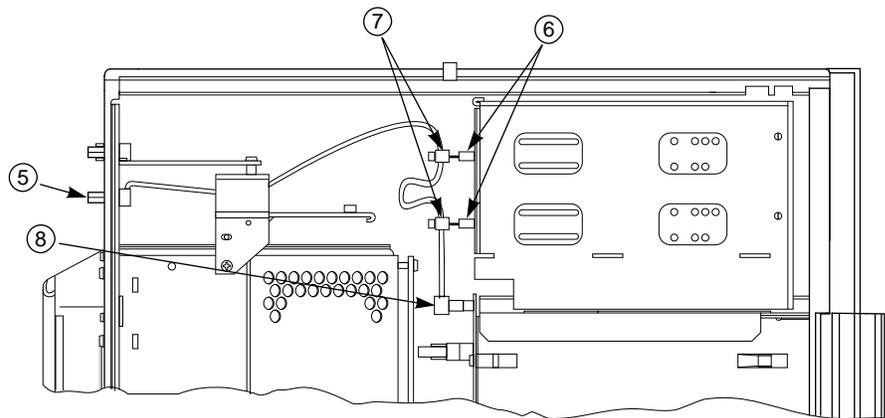

CXO-4990A-MC

**CAUTION**

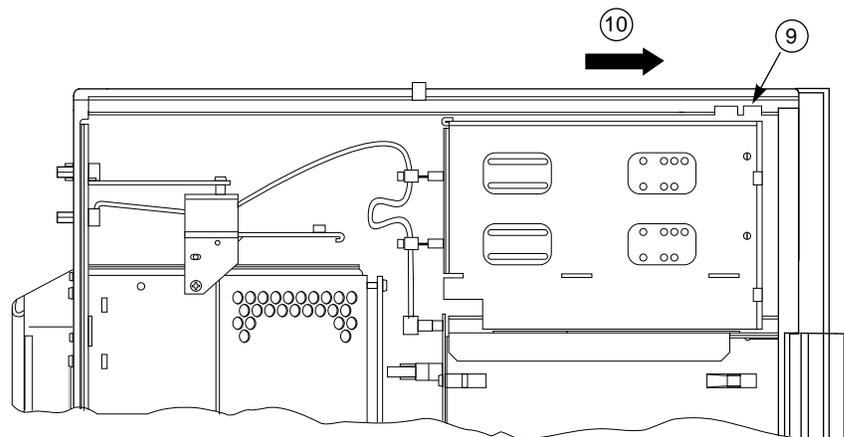

The only *compatible* 68-pin to 50-pin storage device adapter cables are part number 12-04009-02. The similar appearing adapter cable, part number 12-04009-01, *is not storage device compatible* and can be used only with storage controllers.

1. Mount the storage device 68-conductor input cable connector on the rear panel.
2. Connect a storage device adapter cable to each device with a 50-pin output connector.
3. Connect a 68-conductor device input cable connector to each device or each device adapter cable.
4. Connect the device input cable to SCSI bus backplane connector J10.

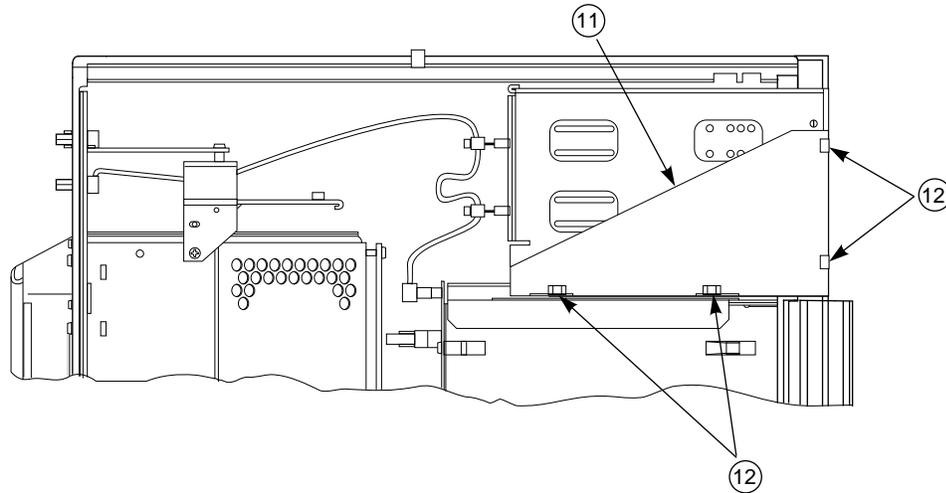

CXO-4991A-MC

5. Align the top front of the modular carrier with the notch in the top edge of the pedestal, slide the carrier into the pedestal and push it against the right side.
6. There are two hooks on the right side of the modular carrier. These hooks fit into slots on the right side of the pedestal. Slide the carrier forward so that the hooks engage the slots in the pedestal. The modular carrier mounting holes must align with the pedestal mounting holes.

CXO-5015A-MC

7. Insert the angle bracket flush against the front of the enclosure. Align the bracket mounting slots with the carrier mounting slots.
8. Install the carrier mounting screws removed in Step 1. Install the front angle bracket mounting screws (refer to Section 6.4).

CXO-4992A-MC

9. Set the pedestal configuration address to a valid, 8-bit device address. The default address for a single bus is **1**; the default address for a dual bus is **0**. See the *HA720W High-Availability Pedestal OEM Product Specification* for other valid, 8-bit device addresses.
  10. Test the pedestal for proper operation by completing the procedure in Section 1.5.
- THIS COMPLETES THE STORAGE DEVICE OPTION INSTALLATION PROCEDURE.
