## REVISION HISTORY

| Date         | Version | Description     |
|--------------|---------|-----------------|
| Jan 28, 2011 | V1.00   | Initial release |
| Jun 15, 2011 | V1.01   | Graphics update |

# 1. Introduction

XS26GS Managed SFP Based Optical Ethernet Switch is a high-performance managed Layer 2+ Gigabit Ethernet switch for service providers. It offers up to twenty-six SFP based Gigabit Ethernet fiber optic ports.

XS26GS is targeted at the emerging market of Ethernet based FTTx. It comes with a rich feature set to meet the requirements of a wide range of applications, especially the access network and the small-to-medium-scale customized network. The design of dual power supply provides the power redundancy for applications requiring high reliability. XS26GS is low-profile with a standard rack-mount size. It achieves the highest fiber port density within a single rack, providing users with the best performance/price ratio.

## 1.1 Features

- A range of configurable copper and fiber ports to meet the requirement of various applications, such as FTTH, optical LAN, Ethernet-based DCS and security surveillance system.
- 8K address table for auto-learned unicast or static unicast/multicast addresses.
- Jumbo frame of up to 9216 bytes
- 802.1p, Port, and DiffServ based QoS package classification with 4 priority queues. Support queue mapping and DSCP mapping.
- 4K 802.1Q based VLAN
- Port based VLAN
- 16 Protocol based VLAN
- MAC based VLAN
- Guest VLAN
- VLAN VPN, QinQ
- GARP/GVRP
- 16 trunk groups of up to 8 member ports with flexible load distribution control and fail-over functions.
- Manual, static, and dynamic port aggregation
- 802.1d Spanning Tree Protocol, 802.1w Rapid Spanning Tree Protocol, and 802.1s Multiple Spanning Tree Protocol.
- By-port egress, ingress, and bi-direction rate control
- Multi combination of MAC address, VID, and port binding
- Static and dynamic MAC addressing
- Blackhole MAC address filtering
- IGMP Snooping
- Multicast VLAN Registration (MVR)
- Link Layer Discovery Protocol (LLDP)
- Storm Control for any combination of multicast, broadcast, and DLF traffic
- Access Control Lists (ACL)
- Secure Shell (SSH) v2.0
- 802.1x Port-based access control and MAC authentication
- User configurable port mirroring supports ingress/egress/both data flow monitoring on one or more ports.
- SNMP v1/v2c/v3
- Web page management
- Command Line Interface (CLI)
- Telnet and RS232 console management

- User account assignable to one of the three access privilege levels
- On-line firmware upgrade
- Configuration file backup and restore
- Dual power supply modules provide power redundancy with status monitoring features.

## 1.2 Face Panel

The face panel of the XS26GS optical Ethernet switch is shown in the following figure.

## 1.3 SFP Based Optical Interface Options

- 1000Base-X
  - Dual multimode fiber(50/125 $\mu$ m), single wavelength 850nm, dual LC connector, 550m reach.
  - Dual multimode fiber(62.5/125 $\mu$ m), single wavelength 850nm, dual LC connector, 275m reach.
  - Dual single-mode fiber, single wavelength 1310nm or 1550nm, dual LC connector, 15/40 km reach.

## 1.4 Power Supply Options

- AC90~264V/1.2A max, 50/60Hz, or
- DC18~36V/2A, or
- DC36~72V/1.5A
- Power Consumption: no more than 45W

## 1.5 Physical and Environmental

- Dimensions: 19-inch rack-mount width, 1.0U height
- Weight: ~5Kg
- Operating temperature: 0°C ~ 50°C
- Storage temperature: -25°C ~ 85°C
- Humidity: 5% ~ 95% RH Non-condensing

## 1.6 Default Configuration

### (1) Administration

IP:

IP Address: 192.168.0.253  
IP Sub network: 255.255.255.0  
IP Gateway: 192.168.0.201

Accounts:

|             |         |         |               |
|-------------|---------|---------|---------------|
| User Level: | Visitor | User    | Administrator |
| User Name:  | guest   | manager | superuser     |
| Password:   | (none)  | 123     | 123           |

### (2) Port

State: enabled  
Flow Control: disabled  
Learning: enabled  
Rate limit: disabled  
Negotiation: enabled

### (3) VLAN

VLAN mode: none  
Static VLAN: 1, including all ports  
Port VID: 1  
Port link type: hybrid  
Frame type: admit all

### (4) SNMP

Version: v1  
Community: public  
Privilege: RO  
User: (none)  
SNMP trap: enabled  
Trap host IP: (none)

### (5) Protocols

IGMP Snooping: Disabled  
GARP/GVRP: Disabled  
STP: Disabled  
LACP: Disabled  
802.1x: Disabled  
LLDP: Disabled

## 1.7 Management Software Specification

The following table summarizes the protocols supported by the managed optical Ethernet switch in the current software release.

|                             |  |
|-----------------------------|--|
| TCP/IP                      | ARP, ICMP, IP, TCP, UDP  |
| SNMP                        | SNMP v2(1,2,3,9), FMC private MIBS, MIB counters of groups 1,2,4,9 |
| Web management server       | Http Server. Support goahead-2.1.8.Java scripts, Java Applet, CGI  |
| Telnet server               | Telnet 1.0   |
| Console                     | Standard UART  |
| Spanning tree protocol      | IEEE 802.1d/1w/1s  |
| Four-level priority queuing | IEEE 802.1p  |
| Port-based VLAN             | SVL  |
| Tag-based VLAN              | IEEE 802.1q (IVL and SVL), GVRP                                    |
| Protocol-based VLAN         | IEEE 802.1v  |
| Trunking                    | IEEE 802.3ad, LACP   |
| Authentication              | IEEE 802.1x  |
| IGMP Snooping               | RFC2236  |

## 2. Web Management Function

A Web browser has been provided to manage and monitor the switch. The default values are set in section 1.6 of this manual. When logging to the switch, you can browse <http://192.168.0.253> and type the user name and password as shown in section 1.6 above.

If you need to change IP address at the first time, you can modify it through RS232 console, or using telnet to login.

### 2.1 Conventions

| Convention      | Description   |
|-----------------|---|
| <b>Boldface</b> | Keywords on web management page is in <b>Boldface</b> |
| <i>italic</i>   | Tag page name is in <i>italic</i>                     |
| <>              | Button on web management page is in <>                |

### 2.2 System Information

At login, the web is on System Information page, which shows the basic information of the switch as below.

The screenshot shows the XENYA web management interface. At the top, there is a header with the XENYA logo and a physical switch image showing 24 ports and a console port. Below the header is a navigation menu on the left with the following items: System Information (selected), Advanced Configuration, Port Management, VLAN, QoS, Forwarding, Security, ACL, LLDP, Statistics, Spanning Tree, SNMP Manager, Administration, and Logout. The main content area is titled 'System Information' and contains a table with the following data:

| System Information  |                          |
|---------------------|--------------------------|
| System Name         | XS26GS                   |
| System Location     | Ljubljana, Slovenia      |
| MAC Address         | 28:b0:cc:0a:21:b0        |
| Hardware Version    | 1.0SFP                   |
| Kernel Version      | 1.00                     |
| Software Version    | 1.071                    |
| Boot Loader Version | 1.0.1                    |
| Serial Number       | R3A1234561               |
| Temperature Status  | 33.5 degree Celsius      |
| Powers Status       | A: Off, B: On            |
| Fans Status         | Normal                   |
| Local Date Time     | Thu Nov 11 03:15:47 2010 |
| GE1 Information     | -                        |
| GE2 Information     | -                        |

## 2.3 Advanced Configuration

This page configures whether to globally enable or disable the following protocols:

- IGMP Snooping
- GVRP
- STP
- LACP
- Authentication
- LLDP
- LBD
- LBD Interval Time
- XS View

**IGMP Snooping:** globally enable or disable the protocol.

**GVRP:** globally enable or disable the protocol.

**STP:** globally enable or disable the protocol.

**LACP:** globally enable or disable the protocol.

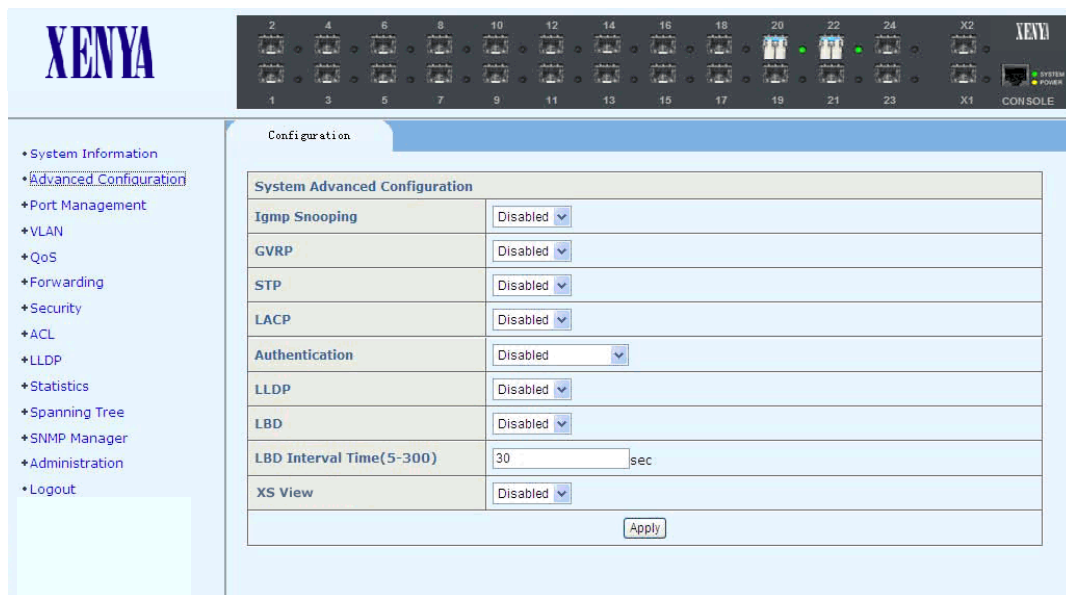

**Authentication:** select authentication between 802.1x or MAC based, or disable the authentication.

**LLDP:** globally enable or disable the protocol.

**LBD:** used to globally enable loopback detection function on this switch. It will check whether there is a loop on the switch on any VLAN. If there is one on a VLAN, it will shut down the port or will send out a trap.

**LBD Interval Time:** time interval for loopback detection, in the range of 5 to 300 (seconds). The default value is 30.

**XS View:** enable or disable the XS View management software.

## 2.4 Port Management

This page configures port related management functions as below:

- Port Configuration
- Port Aggregation
- Port Bandwidth
- Port Mirroring

## 2.4.1 Port Configuration

This page configures a port. When the setup is completed, click <Apply> to take effect.

**LBD:** enables loopback detection for the specific port.

**LBD Control:** enable or disable LBD Control for the specific port. If the loopback port control function is enabled on a trunk or hybrid port when a loop is found, the switch will disable the port, and remove the corresponding MAC forwarding entries. On the other hand, if the loopback port control function is disabled on a trunk or hybrid port when a loop is found, the port will not be disabled. For an access port, the switch will disable the port if a loop is found, as far as LBD is enabled, no matter LBD Control is enabled or disabled.

By default, the loopback port control function is disabled on a trunk or hybrid port.

A list of the port status is also provided. See the following figure for more details.

The screenshot shows the XENYA switch configuration interface. At the top, there is a physical port status indicator with 24 ports and a console port. Below this, the configuration page for Ethernet0/1 is displayed, showing settings for State (Enabled), Negotiation (Auto), Speed&Duplex (1000M Full), Flow Control (Off), Learning (Enabled), LBD (Disabled), and LBD Control (Disabled). An 'Apply' button is visible below the configuration fields.

Below the configuration fields is the 'Port Status' table, which lists the status of all 24 Ethernet ports. The table has columns for Port, State, Link, Negotiation, Speed&Duplex Config, Speed&Duplex Actual, Flow Control Config, Flow Control Actual, Learning, LBD, and LBD Control.

| Port         | State   | Link | Negotiation | Speed&Duplex Config | Speed&Duplex Actual | Flow Control Config | Flow Control Actual | Learning | LBD      | LBD Control |
|--------------|---------|------|-------------|---------------------|---------------------|---------------------|---------------------|----------|----------|-------------|
| Ethernet0/1  | Enabled | Up   | Auto        | -                   | 1000M Full          | Off                 | Off                 | Enabled  | Disabled | Disabled    |
| Ethernet0/2  | Enabled | Up   | Auto        | -                   | 1000M Full          | Off                 | Off                 | Enabled  | Disabled | Disabled    |
| Ethernet0/3  | Enabled | Up   | Auto        | -                   | 100M Full           | Off                 | Off                 | Enabled  | Disabled | Disabled    |
| Ethernet0/4  | Enabled | Down | Auto        | -                   | -                   | Off                 | -                   | Enabled  | Disabled | Disabled    |
| Ethernet0/5  | Enabled | Down | Auto        | -                   | -                   | Off                 | -                   | Enabled  | Disabled | Disabled    |
| Ethernet0/6  | Enabled | Down | Auto        | -                   | -                   | Off                 | -                   | Enabled  | Disabled | Disabled    |
| Ethernet0/7  | Enabled | Down | Auto        | -                   | -                   | Off                 | -                   | Enabled  | Disabled | Disabled    |
| Ethernet0/8  | Enabled | Down | Auto        | -                   | -                   | Off                 | -                   | Enabled  | Disabled | Disabled    |
| Ethernet0/9  | Enabled | Down | Auto        | -                   | -                   | Off                 | -                   | Enabled  | Disabled | Disabled    |
| Ethernet0/10 | Enabled | Down | Auto        | -                   | -                   | Off                 | -                   | Enabled  | Disabled | Disabled    |
| Ethernet0/11 | Enabled | Down | Auto        | -                   | -                   | Off                 | -                   | Enabled  | Disabled | Disabled    |
| Ethernet0/12 | Enabled | Down | Auto        | -                   | -                   | Off                 | -                   | Enabled  | Disabled | Disabled    |
| Ethernet0/13 | Enabled | Down | Auto        | -                   | -                   | Off                 | -                   | Enabled  | Disabled | Disabled    |
| Ethernet0/14 | Enabled | Down | Auto        | -                   | -                   | Off                 | -                   | Enabled  | Disabled | Disabled    |
| Ethernet0/15 | Enabled | Down | Auto        | -                   | -                   | Off                 | -                   | Enabled  | Disabled | Disabled    |
| Ethernet0/16 | Enabled | Down | Auto        | -                   | -                   | Off                 | -                   | Enabled  | Disabled | Disabled    |
| Ethernet0/17 | Enabled | Down | Auto        | -                   | -                   | Off                 | -                   | Enabled  | Disabled | Disabled    |
| Ethernet0/18 | Enabled | Down | Auto        | -                   | -                   | Off                 | -                   | Enabled  | Disabled | Disabled    |
| Ethernet0/19 | Enabled | Down | Auto        | -                   | -                   | Off                 | -                   | Enabled  | Disabled | Disabled    |
| Ethernet0/20 | Enabled | Down | Auto        | -                   | -                   | Off                 | -                   | Enabled  | Disabled | Disabled    |

## 2.4.2 Port Aggregation

XS26GS switch supports up to 16 link aggregation groups, and each group can have up to 8 ports.

This page sets link aggregation. There are three types of aggregation: manual, static, and dynamic. The following is a detailed description of each type of aggregation:

**Manual aggregation:** a manual trunk can only be manually set or deleted; any port in a manual trunk shall have this port's Link Aggregation Control Protocol (LACP) disabled, while the global LACP can be either enabled or disabled.

**Static LACP aggregation:** a static LACP trunk can only be manually set or deleted; any

port in a static LACP trunk shall have this port's Link LACP enabled. When a static LACP trunk is (manually) deleted, all ports of this trunk with "up" status will generate one or more dynamic LACP trunks automatically.

**Dynamic LACP aggregation:** a dynamic LACP trunk can only be set or deleted automatically by the protocol; any port in a dynamic LACP trunk shall have this port's LACP enabled.

A trunk may be configured as a mirror port, but it is not allowed to configure a trunk as a monitoring port.

There are four tag pages on this webpage to configure various parameters:

*Aggregate Groups* – create and configure a trunk. The switch can have up to 13 trunks.

**Trunk ID:** one of the 13 trunk IDs (from T1 to T13) for the user to choose from.

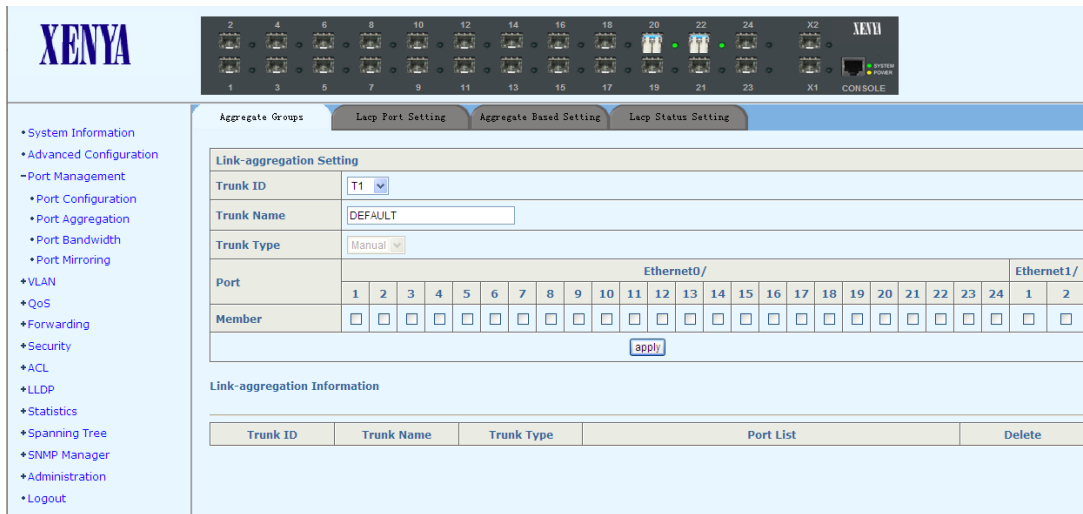

**Trunk Name:** give a name for the selected trunk.

**Trunk Type:** select the trunk to be a manual trunk, or static LACP trunk.

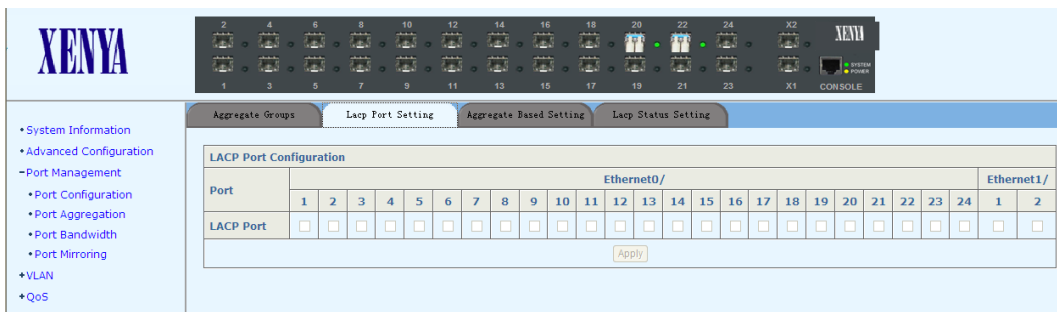

**Port:** choose up to 8 ports to form the trunk.

The bottom part of this tag page lists all existing trunks.

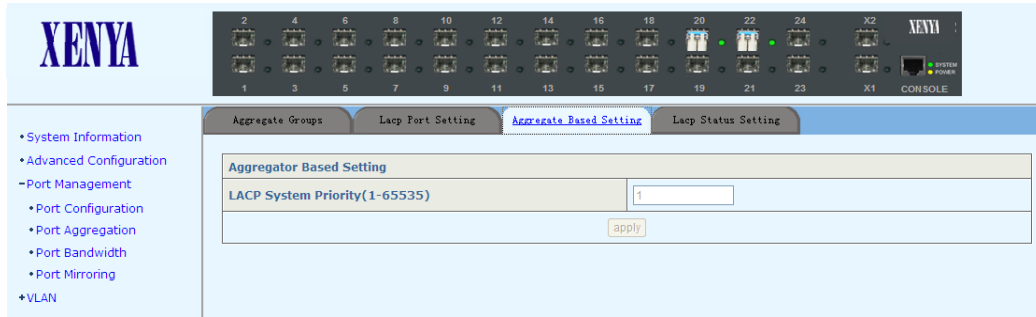

Note: Only when **LACP** in *Advanced Configuration* page is enabled, **Trunk Type** can be selected; otherwise, the **Trunk Type** is **Manual**.

*Lacp Port Setting* – configures LACP ports

*Aggregate Based Setting* – sets LACP system priority, between 1 and 65535

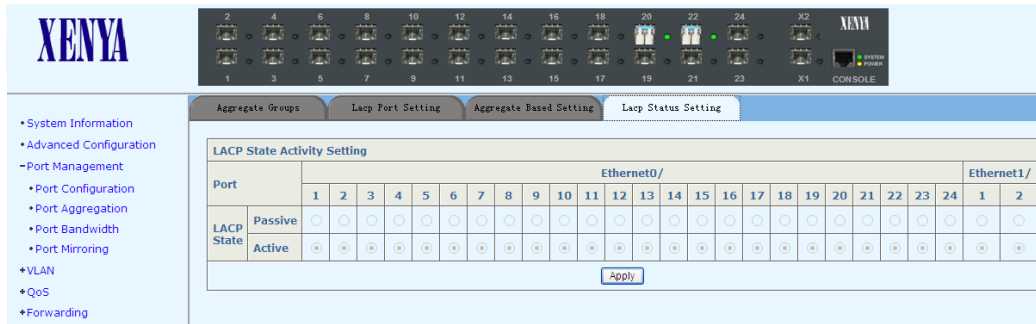

*Lacp Status Setting* – sets LACP active or passive for each port

**Active:** The port automatically sends LACP protocol packets.

**Passive:** The port does not automatically send LACP protocol packets; it responds only if it receives a LACP protocol packet from the opposite device.

A link having either one or two active LACP ports can perform dynamic LACP trunking. A link has two passive LACP ports that will not perform dynamic LACP trunking as both ports are waiting for LACP protocol packet from the opposite device.

### 2.4.3 Port Bandwidth

This page sets the ingress and/or egress rate limit for each port.

**Port:** the port for which the rate limit is configured.

**Ingress:** the desired ingress rate limit to be configured. Choose “disabled” to set the port with no ingress rate limit, which means the port will run in full speed for ingress traffic.

**Egress:** the desired egress rate limit to be configured. Choose “disabled” to set the port with no egress rate limit, which means the port will run in full speed for egress traffic.

When completing a configuration, click <apply> to take effect.

The bottom part of this page shows a full list of rate limit for each port.

**Rate Limit**

Port:  Ingress:  Egress:

**Rate Limit List**

| Port         | Ingress  | Egress   | Port         | Ingress  | Egress   |
|--------------|----------|----------|--------------|----------|----------|
| Ethernet0/1  | Disabled | Disabled | Ethernet0/2  | Disabled | Disabled |
| Ethernet0/3  | Disabled | Disabled | Ethernet0/4  | Disabled | Disabled |
| Ethernet0/5  | Disabled | Disabled | Ethernet0/6  | Disabled | Disabled |
| Ethernet0/7  | Disabled | Disabled | Ethernet0/8  | Disabled | Disabled |
| Ethernet0/9  | Disabled | Disabled | Ethernet0/10 | Disabled | Disabled |
| Ethernet0/11 | Disabled | Disabled | Ethernet0/12 | Disabled | Disabled |
| Ethernet0/13 | Disabled | Disabled | Ethernet0/14 | Disabled | Disabled |
| Ethernet0/15 | Disabled | Disabled | Ethernet0/16 | Disabled | Disabled |
| Ethernet0/17 | Disabled | Disabled | Ethernet0/18 | Disabled | Disabled |
| Ethernet0/19 | Disabled | Disabled | Ethernet0/20 | Disabled | Disabled |
| Ethernet0/21 | Disabled | Disabled | Ethernet0/22 | Disabled | Disabled |
| Ethernet0/23 | Disabled | Disabled | Ethernet0/24 | Disabled | Disabled |
| Ethernet1/1  | Disabled | Disabled | Ethernet1/2  | Disabled | Disabled |

## 2.4.4 Port Mirroring

This page configures the port mirroring function. You can set up 1 to 4 Mirroring Groups, each group can select one Monitoring Port, but more than one Mirroring.

**Monitoring Port:** the port or ports to which the traffic is mirrored

**Rx Port:** all ingress traffic of this port will be mirrored to each of the Monitoring Port(s)

**Tx Port:** all egress traffic of this port will be mirrored to each of the Monitoring Port(s)

**Rx/Tx Port:** all ingress and egress traffic of this port will be mirrored to each of the Monitoring Port(s)

**Mirror**

Port Mirroring Configuration

Mirroring Group:  Monitoring Port:

| Port       | Ethernet0/            |                       |                       |                       |                       |                       |                       |                       |                       |                       |                       |                       |                       |                       |                       |                       |                       |                       |                       |                       |                       |                       |                       |                       | Ethernet1/            |                       |                       |
|------------|-----------------------|-----------------------|-----------------------|-----------------------|-----------------------|-----------------------|-----------------------|-----------------------|-----------------------|-----------------------|-----------------------|-----------------------|-----------------------|-----------------------|-----------------------|-----------------------|-----------------------|-----------------------|-----------------------|-----------------------|-----------------------|-----------------------|-----------------------|-----------------------|-----------------------|-----------------------|-----------------------|
|            | 1                     | 2                     | 3                     | 4                     | 5                     | 6                     | 7                     | 8                     | 9                     | 10                    | 11                    | 12                    | 13                    | 14                    | 15                    | 16                    | 17                    | 18                    | 19                    | 20                    | 21                    | 22                    | 23                    | 24                    | 1                     | 2                     |                       |
| None       | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> |
| Rx Port    | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> | <input type="radio"/> |

**Mirroring Group List**

| Group ID | Monitor Port | Mirroring Rx Port | Mirroring Tx Port | Modify | Delete |
|----------|--------------|-------------------|-------------------|--------|--------|
|          |              |                   |                   |        |        |

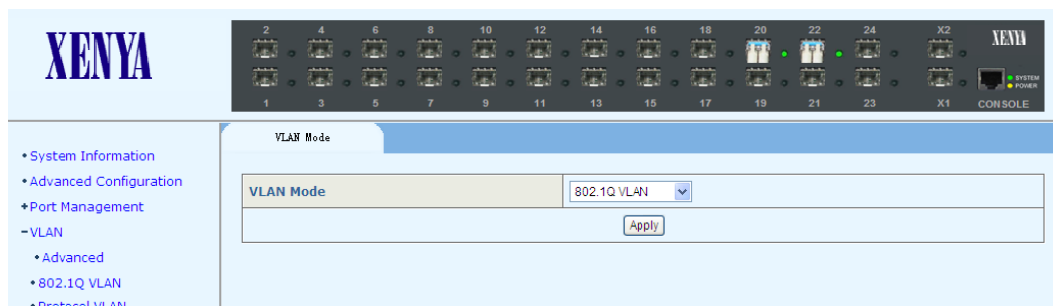

## 2.5 VLAN

This managed switch supports 802.1Q, port-based, mac-based vlan, vlan-vpn and protocol-based VLAN.

VLAN is disabled in default configuration.

### 2.5.1 Advanced

This page globally sets the VLAN mode from the following: no VLAN, 802.1Q VLAN, and port-based VLAN.

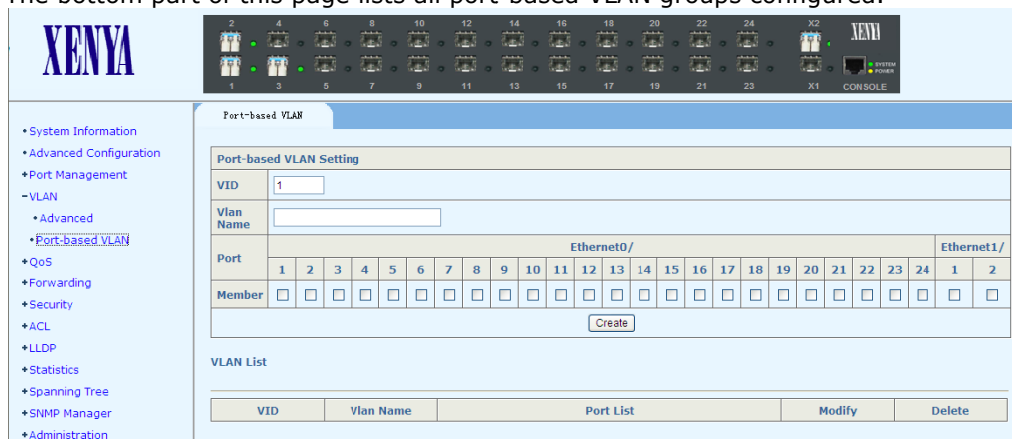

### 2.5.2 Port-based VLAN

On this page, the user can create a new VLAN group with specific VID and VLAN group name. Up to 256 VLAN groups can be created; each VLAN group can have an ID number from 1 to 4094.

**Member:** checks to indicate the port is a member of the VLAN group.

The bottom part of this page lists all port-based VLAN groups configured.

### 2.5.3 802.1Q VLAN

There is a default VLAN group with VLAN identifier (VID) of 1, each port is a member of this group in default, and remains as a member before it is removed from the group.

There are three tag pages on this webpage for the user to configure various parameters:

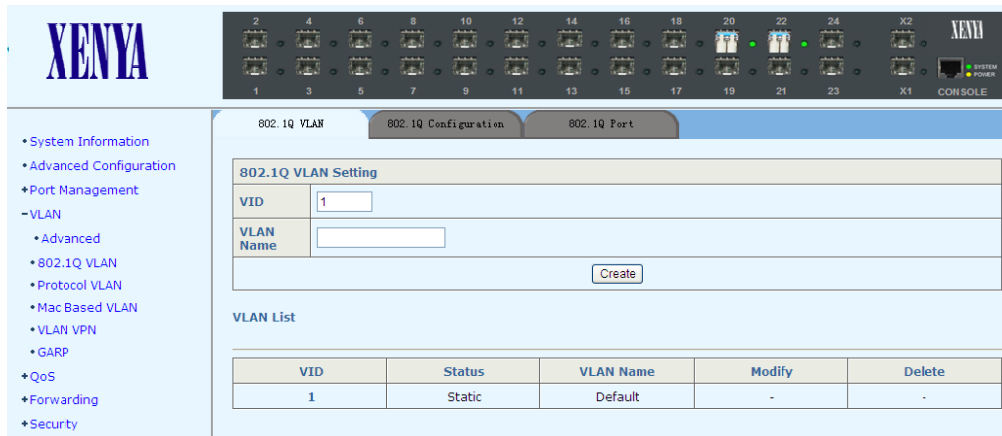

#### 2.5.3.1 802.1Q VLAN

On this tag page, the user can create a new VLAN group with specific VID and VLAN group name. Up to 256 VLAN groups can be created; each VLAN group can have an ID number from 1 to 4094.

The bottom part of this page lists all existing VLAN groups, as well as the information on each VLAN group. Users can also modify or delete an existing VLAN group.

Note: It is not allowed to delete VLAN group 1.

### 2.5.3.2 802.1Q Configuration

This tag page configures a VLAN group; each port can be configured as a specific state for this VLAN group:

**Tagged:** indicates the port is a tagged member of the VLAN group. All packets forwarded by the port are tagged. The packets contain VLAN information.

**Untagged:** indicates the port is an untagged VLAN member of the VLAN group. Packets forwarded by the port are untagged.

**Exclude:** excludes the port from the VLAN group. However, the port can be added to the VLAN group through GARP.

**Forbidden:** does not allow the port to be added to the VLAN group, even if GARP indicates so.

### 2.5.3.3 802.1Q Port

This tag page configures 802.1Q VLAN port parameters:

**PVID:** each port can have only one Port VLAN ID (PVID), an untagged Ethernet package will be tagged a VID of PVID when arriving at the port. The default PVID is 1 for each port.

**Link Type:** can choose **Access**, **Trunk**, or **Hybrid** (by default) from this pull-down block. An **Access** port has only one VLAN and the tag is removed when egress (i.e. **Untagged**); a **Trunk** port can have multiple VLANs, and all packages are tagged, except when an egress package is in a VLAN group with VID the same as PVID; a **Hybrid** port is similar to a **Trunk** port, except it leaves the user a flexibility of configuring each port's **Tagged** or **Untagged**.

**Ingress Fliter:**When enabled, an Ethernet package is discarded if this port is not a member of the VLAN with which this package is associated. When disabled(by default), all packages are forwarded in accordance with the 802.1Q VLAN bridge specification.

**Frame Type:** chooses how the port accepts Ethernet package. When **Admit All** is selected, the port accepts all ingress packages; while **Admit Only Tagged** accepts tagged packages, and discards untagged ones.

The bottom part of this tag page lists the status of all ports.

The screenshot shows the XENYA switch management interface. At the top, there is a physical port layout diagram. Below it, the configuration page for '802.1Q Port' is displayed. The configuration form includes fields for Port (Ethernet0/1), PVID (1), Link Type (Trunk), Ingress Filter (Disabled), and Frame Type (Admit All). Below the form is a table titled 'Port Status' which lists the configuration for all 24 ports.

| Port         | PVID | Link Type | Ingress Filter | Frame Type |
|--------------|------|-----------|----------------|------------|
| Ethernet0/1  | 1    | Trunk     | Disabled       | Admit All  |
| Ethernet0/2  | 1    | Hybrid    | Disabled       | Admit All  |
| Ethernet0/3  | 1    | Hybrid    | Disabled       | Admit All  |
| Ethernet0/4  | 1    | Hybrid    | Disabled       | Admit All  |
| Ethernet0/5  | 1    | Hybrid    | Disabled       | Admit All  |
| Ethernet0/6  | 1    | Hybrid    | Disabled       | Admit All  |
| Ethernet0/7  | 1    | Hybrid    | Disabled       | Admit All  |
| Ethernet0/8  | 1    | Hybrid    | Disabled       | Admit All  |
| Ethernet0/9  | 1    | Hybrid    | Disabled       | Admit All  |
| Ethernet0/10 | 1    | Hybrid    | Disabled       | Admit All  |
| Ethernet0/11 | 1    | Hybrid    | Disabled       | Admit All  |
| Ethernet0/12 | 1    | Hybrid    | Disabled       | Admit All  |
| Ethernet0/13 | 1    | Hybrid    | Disabled       | Admit All  |
| Ethernet0/14 | 1    | Hybrid    | Disabled       | Admit All  |
| Ethernet0/15 | 1    | Hybrid    | Disabled       | Admit All  |
| Ethernet0/16 | 1    | Hybrid    | Disabled       | Admit All  |
| Ethernet0/17 | 1    | Hybrid    | Disabled       | Admit All  |
| Ethernet0/18 | 1    | Hybrid    | Disabled       | Admit All  |
| Ethernet0/19 | 1    | Hybrid    | Disabled       | Admit All  |
| Ethernet0/20 | 1    | Hybrid    | Disabled       | Admit All  |
| Ethernet0/21 | 1    | Hybrid    | Disabled       | Admit All  |
| Ethernet0/22 | 1    | Hybrid    | Disabled       | Admit All  |

## 2.5.4 Protocol VLAN

This page configures protocol VLAN. The pull down **VID** block lists all existing VLAN groups for users to choose a group to configure. For a selected VLAN group, the **Frame Type** lists all protocols for which users can choose. **Ethernet Type** is bundled with the **Frame Type** chosen, except for **Ethernet II**, for which users can type in an **Ethernet Type**. Coressponding **Port** is selected when setting **Protocol VLAN** group. The bottom part of this page lists all protocol VLAN groups configured.

## 2.5.5 MAC-based VLAN

This page configures mac-based VLAN. The pull down **VID** block lists all existing VLAN groups for the user to choose a group to configure. For a selected VLAN group, the **MAC Address** is the source MAC address of incoming packets, and the **Priority** is the added VLAN tag priority.

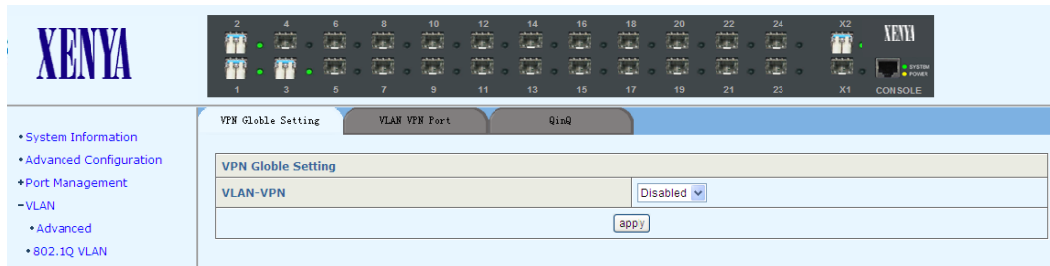

The bottom part of this page lists all mac-based VLAN groups configured.

## 2.5.6 VLAN VPN

### 2.5.6.1 VPN Global Setting

This page enables or disables global VLAN VPN.

**VLAN VPN:** enable or disable the global VLAN VPN.

### 2.5.6.2 VLAN VPN Port

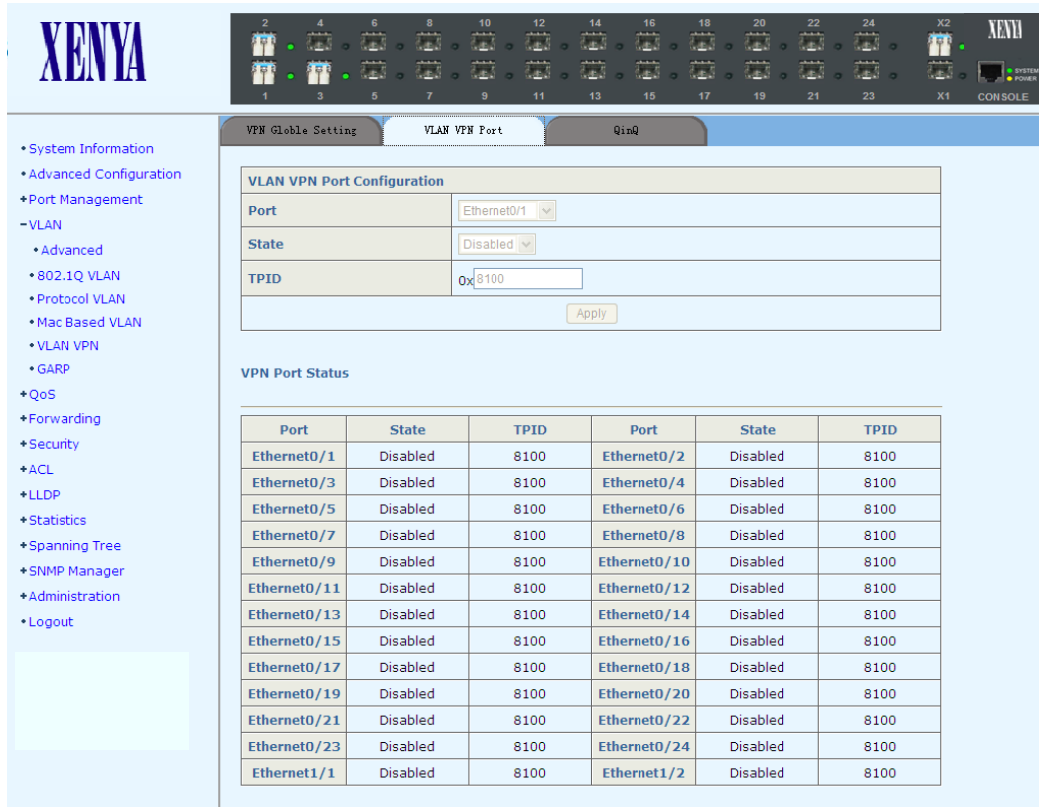

This page enables or disables VLAN VPN and sets TPID (Tag Protocol Identifier) value for a specific port. The default TPID value is 0x8100. Be aware that some other vendors' switches may set this value to be 0x9100.

**Port:** select a specific port for setting.

**State:** To enable or disable a specific port.

**TPID:** To set TPID value, 0x8100 by default. TPID is used to identify whether the packets carry specific VLAN Tag. Note that the location of the TPID field in an Ethernet packet is the same as the protocol type field in a packet without VLAN Tag. Thus, to prevent confusion from happening, the following protocol type values should not be configured as a TPID value.

- ARP: 0x0806
- IP: 0x0800
- MPLS: 0x8847/0x8848
- IPX: 0x8137
- IS-IS: 0x8000
- LACP: 0x8809
- 802.1x: 0x888E

### 2.5.6.3 Qinq

Qinq is an enhanced feature of VLAN-VPN. An Outer Tag can be added, which is based on the inner Tag. In this page, you can set Qinq parameters as **Outer Tag VID**, **Inner Tag VID**, **Outer Tag Priority** and **Port**.

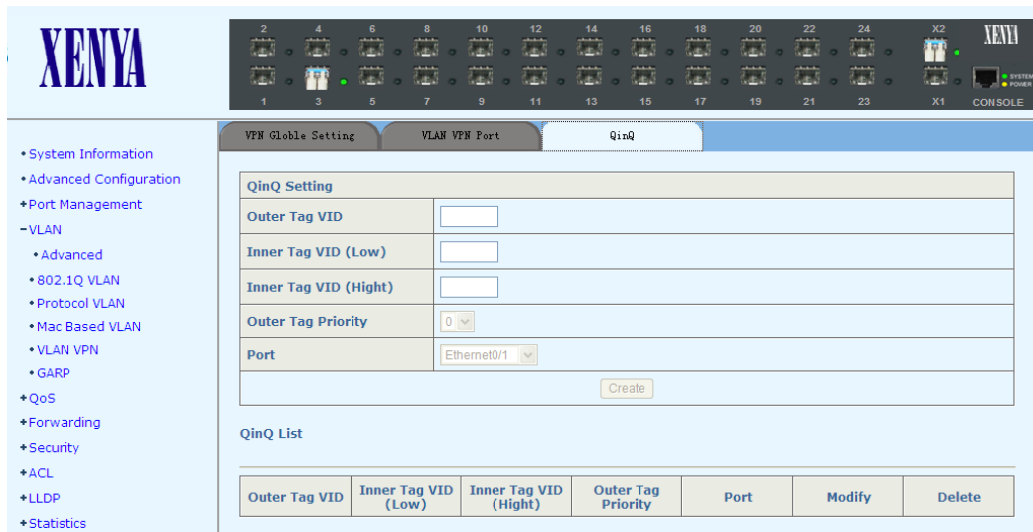

**Outer Tag VID:** A VLAN ID for the outer tag that will be added to the packet.

**Inner tag VID(Low)/ Inner tag VID(High):** An outer tag is added to form a double tag package, if the incoming package has a VLAN ID value between **Inner tag VID(Low)** and **Inner tag VID(High)** (all inclusive).

**Outer Tag Priority:** the outer tag VLAN priority, in the range of 0 to 7.

**Port:** the double tag port from which a package is received.

The bottom part of this page lists all configured Qinq mapping rules.

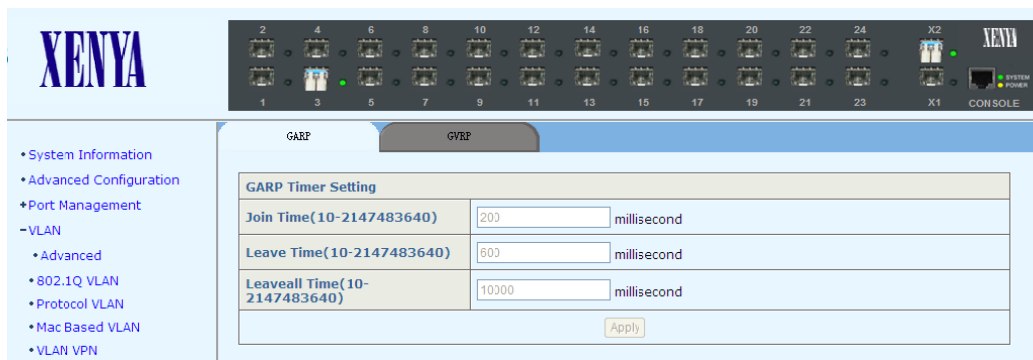

## 2.5.7 GARP

GARP VLAN Registration Protocol (GVRP) is based on Generic Attribute Registration Protocol (GARP). They are standard protocols described in IEEE 802.1D.

Before configuring GARP, make sure GVRP is enabled (see section 2.2 of this manual for details). There are two tag pages:

**GARP:** this tag page sets GARP **Join Time**, **Leave Time**, and **Leaveall Time**. **Leaveall Time** must be greater than **Leave Time**, and **Leave Time** must be greater than twice the **Join Time**.

**GVRP:** this tag page sets per port GVRP parameters. For a selected **Port**, enabled **GVRP**, the **Registration Type** can be set to **Normal** (default), **Fixed**, or **Forbidden**. **Normal** registration allows dynamic passing, registration, and de-registration of both dynamic and static VLANs; **Fixed** registration allows passing static VLANs, as well as manual registration, de-registration of VLANs; while **Forbidden** prohibits the port from passing, registration, or de-registration of VLANs.

The bottom part of *GVRP* tag page lists the GVRP attribute of all ports.

## 2.6 QoS

This managed switch supports Quality of Service (QoS).

QoS priority is disabled in default configuration.

## 2.6.1 QoS Configuration

This tag page sets per port QoS parameters. For a selected **Port**, set the **Priority, with DSCP enabled**, the **Default Priority** can be set from 0-7.

The bottom part of QoS Configuration tag page lists the default priority of all ports and the state of DSCP.

The screenshot shows the XENYA switch web interface. The top navigation menu includes: System Information, Advanced Configuration, Port Management, VLAN, QoS, Forwarding, Security, ACL, LLDP, Statistics, Spanning Tree, SNMP Manager, Administration, and Logout. The QoS configuration page is active, showing a form for 'Ethernet0/1' with 'Default Priority' set to 0 and 'DSCP' set to Disabled. Below the form is a table titled 'Port Priority List' with the following data:

| Port         | Default Priority | DSCP     | Port         | Default Priority | DSCP     |
|--------------|------------------|----------|--------------|------------------|----------|
| Ethernet0/1  | 0                | Disabled | Ethernet0/2  | 0                | Disabled |
| Ethernet0/3  | 0                | Disabled | Ethernet0/4  | 0                | Disabled |
| Ethernet0/5  | 0                | Disabled | Ethernet0/6  | 0                | Disabled |
| Ethernet0/7  | 0                | Disabled | Ethernet0/8  | 0                | Disabled |
| Ethernet0/9  | 0                | Disabled | Ethernet0/10 | 0                | Disabled |
| Ethernet0/11 | 0                | Disabled | Ethernet0/12 | 0                | Disabled |
| Ethernet0/13 | 0                | Disabled | Ethernet0/14 | 0                | Disabled |
| Ethernet0/15 | 0                | Disabled | Ethernet0/16 | 0                | Disabled |
| Ethernet0/17 | 0                | Disabled | Ethernet0/18 | 0                | Disabled |
| Ethernet0/19 | 0                | Disabled | Ethernet0/20 | 0                | Disabled |
| Ethernet0/21 | 0                | Disabled | Ethernet0/22 | 0                | Disabled |
| Ethernet0/23 | 0                | Disabled | Ethernet0/24 | 0                | Disabled |
| Ethernet1/1  | 0                | Disabled | Ethernet1/2  | 0                | Disabled |

## 2.6.2 Scheduling Mechanism

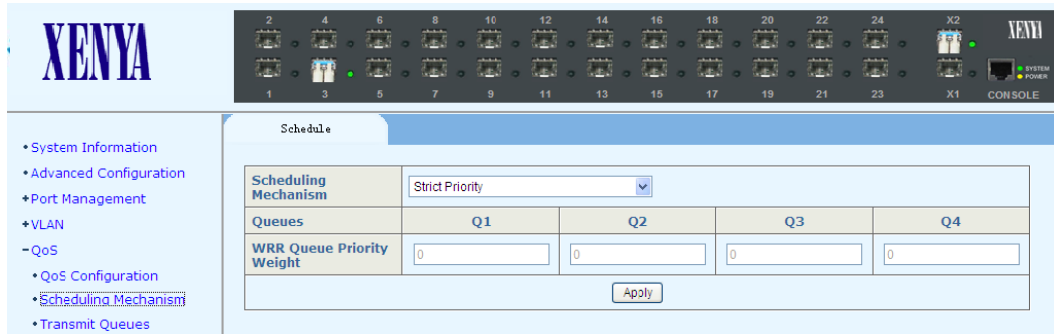

This page sets the queue scheduling algorithm and related parameters.

**Scheduling Mechanism** can be set to **Strict Priority** or **Weighted Round-Robin (WRR)**.

**Strict Priority**: uses the strict priority (SP) algorithm for queue scheduling.

**Weighted Round-Robin (WRR)**: uses the weighted round robin (WRR) algorithm for queue scheduling.

**WRR Queue Priority Weight**: customizes the weights to be assigned to queues 1 through 4. The value ranges from 1 to 55.

## 2.6.3 Transmit Queues

This page sets the 802.1p priority to local precedence mapping. The following table lists the default mapping between 802.1p priority and local precedence:

| 802.1p priority | Local precedence |
|-----------------|------------------|
| 0               | Q1               |
| 1               | Q1               |
| 2               | Q2               |
| 3               | Q2               |
| 4               | Q3               |
| 5               | Q3               |
| 6               | Q4               |
| 7               | Q4               |

## 2.6.4 DSCP Map

This page sets the mapping between the DSCP value and the 802.1p priority.

## 2.7 Forwarding

### 2.7.1 Unicast MAC Address

There are two tag pages:

*MAC Address Configuration*: To add, modify, or delete an entry in MAC table.

**VID**: Specifies a VLAN group to which the MAC address associated.

**Unicast MAC Address**: Specifies the destination MAC address.

**Port**: Specifies the port of the outbound interface.

**Type**: Choose among **Dynamic**, **Static** and **Blackhole**. **Dynamic** indicates a dynamic MAC address entry, **Static** indicates a static MAC address entry, and **Blackhole** indicates a blackhole MAC address entry.

The bottom part of *MAC Address Configuration* tag page lists all existing unicast MAC addresses, as well as the information of each unicast MAC address. The user can also modify or delete an existing unicast MAC address.

The screenshot shows the XENYA switch web interface. At the top, there is a status bar with port indicators (1-24) and system power/console buttons. The main content area is titled 'MAC Address Configuration' and 'Dynamic Unicast MAC'. It features a 'Forwarding Table' with the following structure:

| VID | Unicast MAC Address[xx-xx-xx-xx-xx] | Port        | Type   |
|-----|-------------------------------------|-------------|--------|
| 1   | <input type="text"/>                | Ethernet0/1 | Static |

Below the table is an 'Apply' button. Underneath, there is a 'MAC Address Entries' section with a table structure:

| VID | Unicast MAC Address | Port | Type | Modify | Delete |
|-----|---------------------|------|------|--------|--------|
|-----|---------------------|------|------|--------|--------|

The left sidebar contains a navigation menu with items like System Information, Advanced Configuration, Port Management, VLAN, QoS, Forwarding, Unicast MAC Address, Multicast MAC Address, IGMP Snooping, MVR, Unknown Multicast, and Security.

*Dynamic Unicast MAC*: This page lists all dynamic unicast MAC addresses. An entry can be deleted.

## 2.7.2 Multicast MAC Address

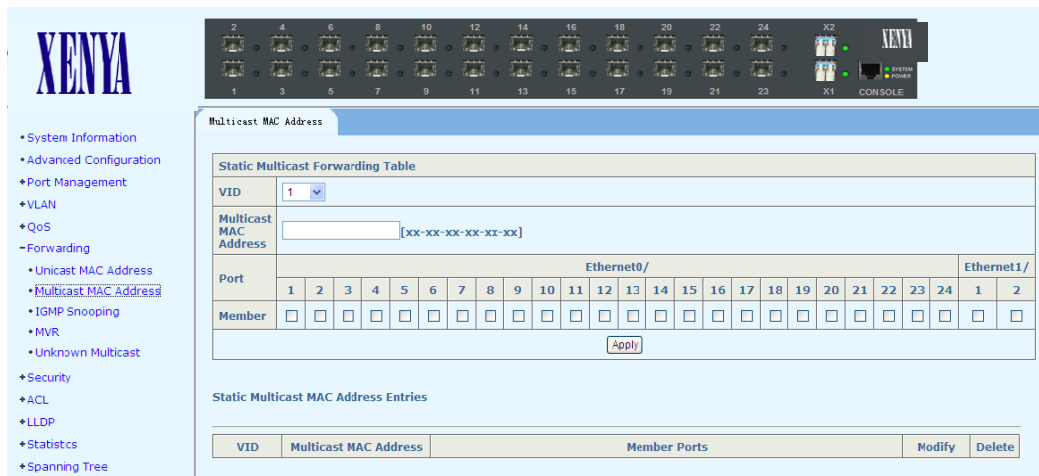

This page sets multicast MAC address entries. Each multicast MAC address entry contains multicast address, forward ports, and VID.

**VID:** Specifies the VLAN group for which the forwarding ports are members.

**Multicast MAC Address:** Multicast MAC address, in the form of H-H-H-H-H-H.

**Member:** Specifies forwarding ports for the specified multicast MAC group address. One or more ports can be added as the member.

The bottom part of this page lists all existing multicast MAC addresses, as well as the information of each multicast MAC address. The user can also modify or delete an existing multicast MAC address.

## 2.7.3 IGMP Snooping

There are three tag pages on this webpage for configuration:

### 2.7.3.1 IGMP Snooping

In this page, the user can enable IGMP Snooping feature for a VLAN group. By default, the IGMP Snooping feature is disabled.

The bottom part of this page lists all VLAN IGMP Snooping feature status.

The screenshot shows the XENYA web interface for IGMP Snooping configuration. On the left is a navigation menu with options like System Information, Advanced Configuration, Port Management, VLAN, QoS, Forwarding, Security, and ACL. The main content area has tabs for IGMP Snooping, Route Port, and Misc. Under IGMP Snooping, there is a form for configuring a specific VLAN. The VID is set to 1, the VLAN Name is 'Default', and the Status is 'Disabled'. An 'Apply' button is present. Below this is a table titled 'IGMP Snooping Status List' showing the status for VID 1, 200, and 100, all of which are 'Disabled'.

| VID | VLAN Name | Status   |
|-----|-----------|----------|
| 1   | Default   | Disabled |
| 200 | VLAN0200  | Disabled |
| 100 | VLAN0100  | Disabled |

### 2.7.3.2 Route Port

In this page, the user can configure a port in a specified VLAN group as a static router port. By default, a port is not a static router port.

The bottom part of this page lists static router ports of all VLANs.

The screenshot shows the XENYA web interface for Static Route Port Configuration. The left navigation menu is similar to the previous page. The main content area has tabs for IGMP Snooping, Route Port, and Misc. Under Route Port, there is a 'Static Route Port Configuration' form. The VID is 1 and the VLAN Name is 'Default'. Below this is a grid of checkboxes for ports 1 through 24 under 'Ethernet0/' and ports 1 and 2 under 'Ethernet1/'. All checkboxes are currently unchecked. An 'Apply' button is at the bottom. Below the form is a table titled 'Static Router Port List' showing that for all three VLANs (1, 200, 100), the 'Route Port' status is '-'. The 'Route Port' column in the table is empty, indicating no ports are currently configured as static router ports.

| VID | VLAN Name | Route Port |
|-----|-----------|------------|
| 1   | Default   | -          |
| 200 | VLAN0200  | -          |
| 100 | VLAN0100  | -          |

### 2.7.3.3 Misc

This tag page sets IGMP Snooping Misc configuration parameters: **Host Timeout, Route Timeout, IGMP Querier, Query Transmit Interval, Max Response**

## Time, Last Member Query Interval, and IGMP Flood.

**Host Timeout** : It is in the range of 200 to 1000; by default, the value is 260 seconds.

**Route Timeout** :It is in the range of 1 to 1000; by default, the value is 105 seconds.

**IGMP Querier** : Enable/disable IGMP Querier function.

**Query Transmit Interval** :It is in the range of 1 to 300, by default, the value is 125 seconds.

**Max Response Time** : It is in the range of 1 to 25, by default, the value is 10 seconds.

**Last Member Query Interval**: It is in the range of 1 to 25, by default, the value is 1 second.

## 2.7.4 MVR

MVR(Multicast VLAN Registration) allows a subscriber on a port to subscribe and unsubscribe a multicast stream on the network-wide multicast VLAN. It allows the single multicast VLAN to be shared in the network while subscribers remain in separate VLANs. MVR provides the ability to continuously send multicast streams in the multicast VLAN, but it isolates the streams from the subscriber VLANs for bandwidth and security reasons.

### 2.7.4.1 MVR Configuration

This page sets MVR State, Multicast VLAN ID, Source Port and Receive Port for MVR configuration.

**MVR State**: globally enable or disable MVR on the switch.

**Multicast VLAN ID**: specify the VLAN group in which multicast data is received. All source ports must be the member of this VLAN. The default VLAN ID is 1.

**MVR Mode**: choose the mode between **compatible** and **dynamic**.

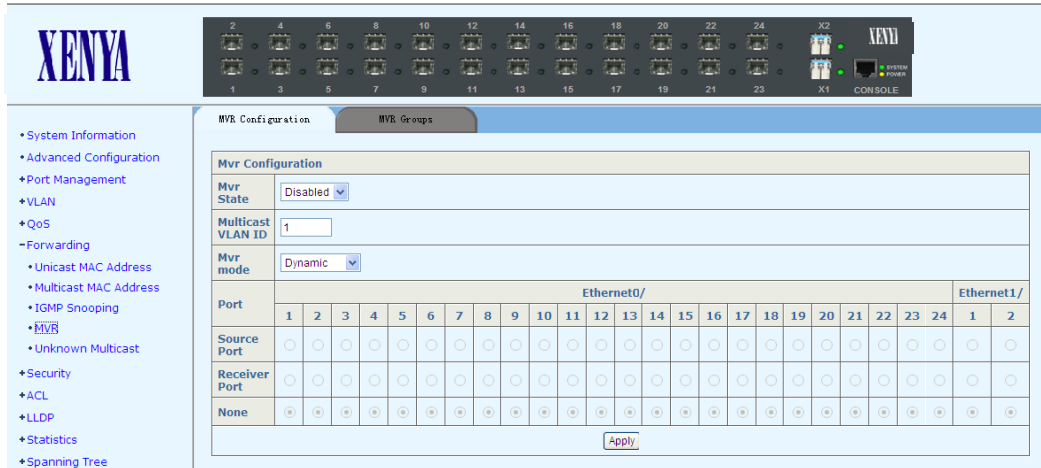

**Compatible mode**: the switch does not send out any IGMP reports to source port(s), a manual multicast forwarding configuration is needed. In the case that MVR Group is not configured, multicast data received by the switch is forwarded to all ports, regardless of the port MVR membership setting. In the case that MVR Group is successfully configured, the multicast data is forwarded only to those joined receiver ports set by MVR static configuration.

**Dynamic mode**: the switch sends IGMP leave and join reports through the source port(s) to the other multicast devices (such as multicast routes or servers) in the multicast VLAN. This allows the multicast devices to update the multicast forwarding

table to forward or not to forward multicast traffic to the receiver ports.

**Source Port:** configure uplink ports that receive and send multicast data as source ports. Subscribers cannot be directly connected to source ports. All source ports on a switch are members of the single multicast VLAN group.

**Receive Port:** configure a port as a receiver port if it is a subscriber port and should receive multicast data. However, it won't be able to receive the multicast data until it becomes a member of the multicast group, either statically or by using IGMP join messages. Receiver ports are untagged members of the multicast VLAN group.

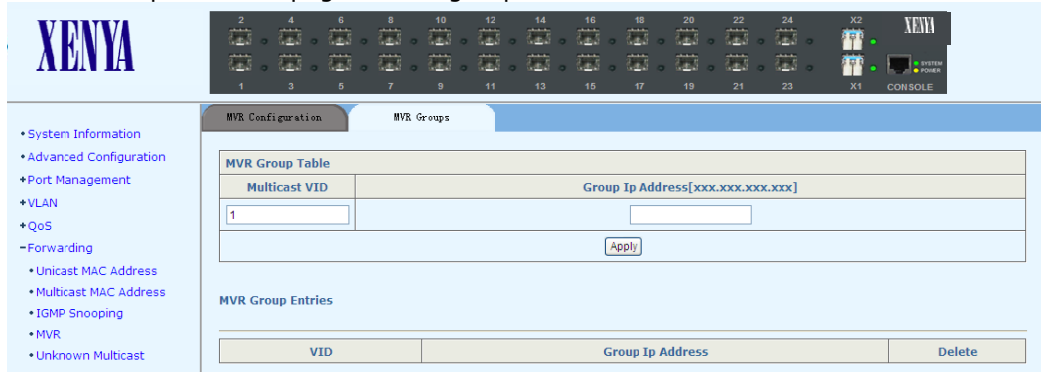

### 2.7.4.2 MVR Groups

This page sets specific static **Group IP Address(es)** for MVR.

**Multicast VID:** multicast VLAN ID

**Group IP Address:** static IP multicast address to be added

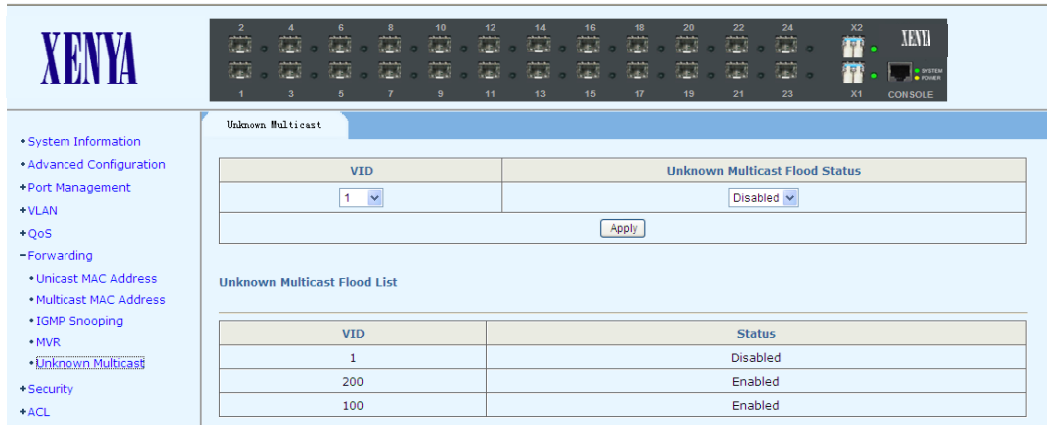

The bottom part of this page lists all group IP addresses for the multicast VLAN.

### 2.7.5 Unknown Multicast

**Unknown Multicast Flood Status:** Enable/disable Unknown Multicast Flood Status for this VLAN group.

The bottom part of this page lists all of the unknown multicast flood

## 2.8 Security

### 2.8.1 Management Security

This page configures the 802.1x system as follows: **Authentication RADIUS Server IP, Authentication Port, Authentication Shared Key, Accounting RADIUS Server IP, Accounting Port and Accounting Shared Key.**

**Authentication RADIUS Server IP:** IP address of the radius server to be used, a valid unicast address in dotted decimal notation; the default value is 192.168.0.234.

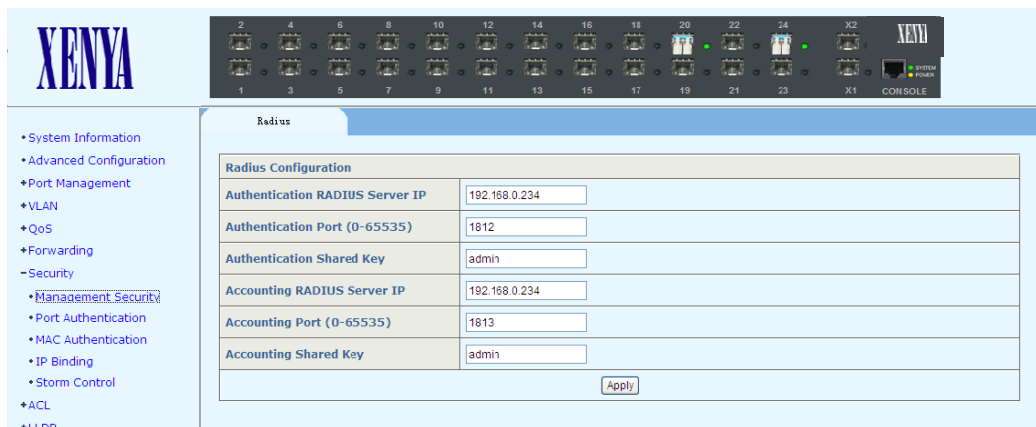

**Authentication Port:** UDP port number of the radius server, ranging from 0 to 65535; the default value is 1812.

**Authentication Shared Key:** sets a shared key for radius messages. String length is from 1 to 15 characters.

**Accounting RADIUS Server IP:** IP address of accounting radius server to be used, a valid unicast address in dotted decimal notation; the default value is 192.168.0.234.

**Accounting Port:** UDP port number of the radius server, ranging from 0 to 65535; the default value is 1813.

**Accounting Shared Key:** sets a shared key for accounting radius. String length is from 1 to 15 characters.

### 2.8.2 Port Authentication

There are two tag pages on this webpage for the user to configure various parameters of 802.1x.

### 2.8.2.1 802.1x Port

This tag page sets 802.1x port enabling, re-authentication, access control, and Guest VLAN for a specified Ethernet port. There are three choices for **PortControl**: **Auto**, **ForceAuthorized**, and **ForceUnauthorized**.

**Auto**: specified to operate in auto access control mode. When one port operates in this mode, all the unauthenticated hosts connected to it are unauthorized. In this case, only EAPoL packets can be exchanged between the switch and the hosts. And the authenticated hosts connected to the port are authorized to access the network resources.

**ForceAuthorized**: specified to operate in authorized-force access control mode. When one port operates in this mode, all the hosts connected to it can access the network resources without the need of authentication.

**ForceUnauthorized**: specified to operate in unauthorized-force access control mode. When one port operates in this mode, the hosts connected to it cannot access the network resources.

**Guest VLAN**: a guest VLAN can be enabled for each IEEE 802.1x port on the switch to provide limited services to the clients.

The bottom part of this page lists all the 802.1x port status.

The screenshot shows the XENYA switch management interface. At the top, there is a physical port layout diagram with ports numbered 1-24 and X1 (CONSOLE). Below this, the '802.1x Port' configuration page is displayed. It features a navigation menu on the left with options like System Information, Advanced Configuration, Port Management, VLAN, QoS, Forwarding, Security, Management Security, Port Authentication, IP Binding, Storm Control, ACL, LLDP, Statistics, Spanning Tree, SNMP Manager, Administration, and Logout. The main configuration area is titled '802.1x Misc' and contains a table for configuring a specific port (Ethernet0/1). The table has columns for Port, 802.1x Admin, PortControl, ReAuth, and Guest VLAN. Below this is an 'Apply' button. Underneath the configuration table is a section titled '802.1x Port Status List' which contains a table listing the status of all 19 Ethernet ports.

| Port        | 802.1x Admin | PortControl     | ReAuth   | Guest VLAN |
|-------------|--------------|-----------------|----------|------------|
| Ethernet0/1 | Disabled     | ForceAuthorized | Disabled | Disabled   |

| Port         | 802.1x Admin | PortControl     | ReAuth   | Guest VLAN | Port State |
|--------------|--------------|-----------------|----------|------------|------------|
| Ethernet0/1  | Disabled     | ForceAuthorized | Disabled | Disabled   | Link Down  |
| Ethernet0/2  | Disabled     | ForceAuthorized | Disabled | Disabled   | Link Down  |
| Ethernet0/3  | Disabled     | ForceAuthorized | Disabled | Disabled   | Link Down  |
| Ethernet0/4  | Disabled     | ForceAuthorized | Disabled | Disabled   | Link Down  |
| Ethernet0/5  | Disabled     | ForceAuthorized | Disabled | Disabled   | Link Down  |
| Ethernet0/6  | Disabled     | ForceAuthorized | Disabled | Disabled   | Link Down  |
| Ethernet0/7  | Disabled     | ForceAuthorized | Disabled | Disabled   | Link Down  |
| Ethernet0/8  | Disabled     | ForceAuthorized | Disabled | Disabled   | Link Down  |
| Ethernet0/9  | Disabled     | ForceAuthorized | Disabled | Disabled   | Link Down  |
| Ethernet0/10 | Disabled     | ForceAuthorized | Disabled | Disabled   | Link Down  |
| Ethernet0/11 | Disabled     | ForceAuthorized | Disabled | Disabled   | Link Down  |
| Ethernet0/12 | Disabled     | ForceAuthorized | Disabled | Disabled   | Link Down  |
| Ethernet0/13 | Disabled     | ForceAuthorized | Disabled | Disabled   | Link Down  |
| Ethernet0/14 | Disabled     | ForceAuthorized | Disabled | Disabled   | Link Down  |
| Ethernet0/15 | Disabled     | ForceAuthorized | Disabled | Disabled   | Link Down  |
| Ethernet0/16 | Disabled     | ForceAuthorized | Disabled | Disabled   | Link Down  |
| Ethernet0/17 | Disabled     | ForceAuthorized | Disabled | Disabled   | Link Down  |
| Ethernet0/18 | Disabled     | ForceAuthorized | Disabled | Disabled   | Link Down  |
| Ethernet0/19 | Disabled     | ForceAuthorized | Disabled | Disabled   | Link Down  |

### 2.8.2.2 802.1x Misc

This tag page configures 802.1x: **Quiet Period**, **Tx Period**, **Supplicant Timeout**, **Server Timeout**, **Max Request Count**, **Reauth Period**, and **Guest VLAN**.

**Quiet Period**: this timer sets the quiet-period. When a supplicant system fails to pass the authentication, the switch quiets for the set period before it processes another authentication request re-initiated by the supplicant system. During this quiet period,

the switch does not perform any 802.1x authentication-related actions for the supplicant system. The value is in the range of 1 to 65535, and is set to 60 seconds by default.

**Tx Period:** sets the transmission timer. This timer sets the tx-period and is triggered in two cases. The first case is when the client requests authentication. The switch sends a unicast request/identity packet to a supplicant system and then triggers the transmission timer. The switch sends another request/identity packet to the supplicant system if it does not receive the reply packet from the supplicant system when this timer times out. The second case is when the switch authenticates the 802.1x client which cannot request for authentication actively. The switch sends multicast request/identity packets periodically through the port enabled with 802.1x function. In this case, this timer sets the interval to send the multicast request/identity packets. It is in the range of 1 to 65535; the default value is 30 seconds.

**Supplicant Timeout:** sets the supplicant system timer. This timer sets the supp-timeout period and is triggered by the switch after the switch sends a request/challenge packet to a supplicant system. The switch sends another request/challenge packet to the supplicant system if the switch does not receive any response from the supplicant system when this timer times out. It is in the range of 1 to 300; the default value is 30 seconds.

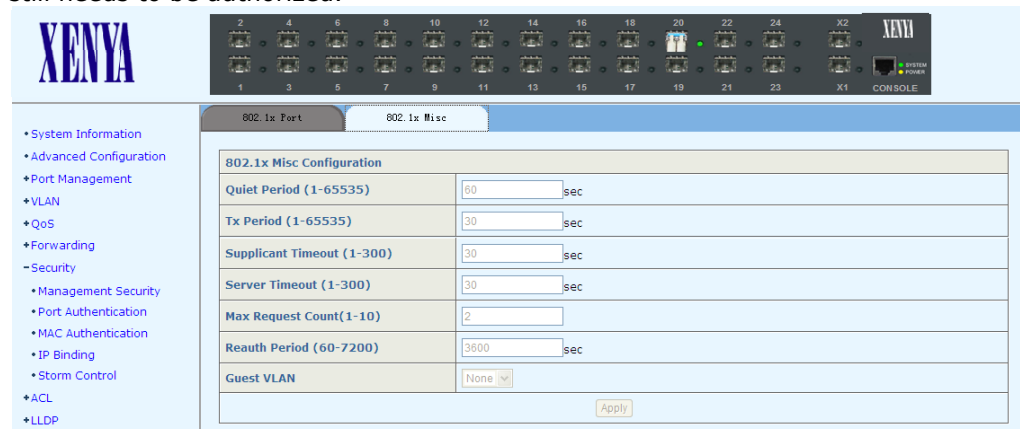

**Server Timeout:** sets the radius server timer. This timer sets the server-timeout period. After sending an authentication request packet to the radius server, a switch sends another authentication request packet if it does not receive any response from the radius server when this timer times out. It is in the range of 1 to 300; the default value is 30 seconds.

**Max Request Count:** sets the maximum number of times that a switch sends authentication request packets to a user. It is in the range of 1 to 10, and the default value is 2.

**Reauth Period:** sets re-authentication interval in seconds. After this timer expires, the switch indicates 802.1x re-authentication. It is in the range of 60 to 7200; the default value is 3600 seconds.

**Guest VLAN:** can choose a guest VLAN on the switch to provide limited services to clients, such as downloading. These clients might be upgraded for IEEE 802.1x authentication.

When enabling a guest VLAN on an IEEE 802.1x port, the switch assigns the client port to a guest VLAN in case that the switch does not receive any response to its EAP request/identity frame, or EAPOL packets are not sent by the client. The switch allows the client that is failed in authentication to access the guest VLAN, regardless of whether EAPOL packets have been detected. However, access to external ports out of guest VLAN still needs to be authorized.

## 2.8.3 MAC Authentication

### 2.8.3.1 Port Conf

This page enables **MAC Authentication** on a specific port.

The screenshot shows the XENYA switch web interface. The top navigation bar includes 'Port Conf', 'Misc', and 'Authenticate Infor'. The 'Port Conf' tab is selected, displaying a form to configure MAC Authentication for a specific port. The form shows 'Ethernet0/1' selected in the 'Port' dropdown and 'Disabled' in the 'MAC Authentication Enable' dropdown. An 'Apply' button is visible below the form.

Below the form is a 'Port Status List' table:

| Port         | MAC Authentication Enable | Port         | MAC Authentication Enable |
|--------------|---------------------------|--------------|---------------------------|
| Ethernet0/1  | Disabled                  | Ethernet0/2  | Disabled                  |
| Ethernet0/3  | Disabled                  | Ethernet0/4  | Disabled                  |
| Ethernet0/5  | Disabled                  | Ethernet0/6  | Disabled                  |
| Ethernet0/7  | Disabled                  | Ethernet0/8  | Disabled                  |
| Ethernet0/9  | Disabled                  | Ethernet0/10 | Disabled                  |
| Ethernet0/11 | Disabled                  | Ethernet0/12 | Disabled                  |
| Ethernet0/13 | Disabled                  | Ethernet0/14 | Disabled                  |
| Ethernet0/15 | Disabled                  | Ethernet0/16 | Disabled                  |
| Ethernet0/17 | Disabled                  | Ethernet0/18 | Disabled                  |

### 2.8.3.2 Misc

This page sets **Offline detect time**, **Quiet Period**, and **Server Timeout** for MAC Authentication.

**Offline detect time:** to check whether the client is offline in this time interval. The switch will immediately notify the RADIUS server to stop billing from the client when offline is detected. The value ranges from 1 to 65535, and the default value is 300 seconds.

**Quiet Period:** to set the time interval the client must wait after a client authentication fails. During this time interval, the switch does not perform the user authentication function. The value ranges from 1 to 3600, and the default value is 60 seconds.

**Server Timeout:** to set the time interval the switch waits for a response, when there is a connection request from the authentication server to the client. The value ranges from 1 to 65535, and the default value is 100 seconds.

The screenshot shows the XENYA switch web interface. The top navigation bar includes 'Port Conf', 'Misc', and 'Authenticate Infor'. The 'Misc' tab is selected, displaying the 'MAC Authentication Misc Configuration' page. The page contains three configuration fields:

- Offline detect time (1-65535): 300 sec
- Quiet Period (1-3600): 60 sec
- Server Timeout (1-65535): 100 sec

An 'Apply' button is visible at the bottom of the configuration area.

### 2.8.3.3 Authenticate Infor

This page lists all the MAC authentication information including **MAC Address**, **From**

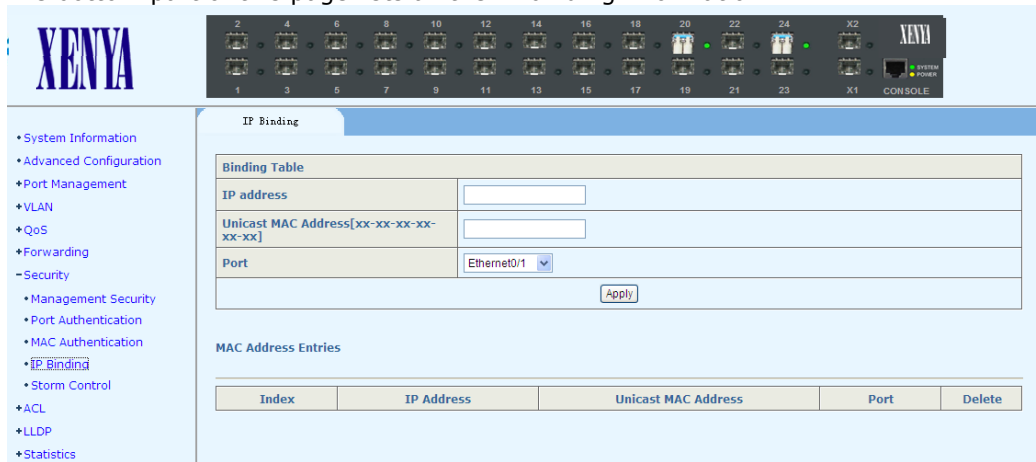

**Port, and Authenticate state.**

## 2.8.4 IP Binding

This page sets **IP address, Unicast MAC Address, and Port** for IP binding.

The bottom part of this page lists all the IP binding information.

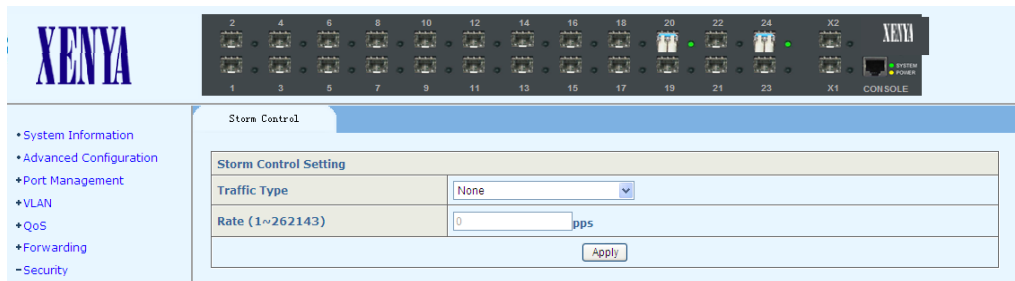

## 2.8.5 Storm Control

This page sets thresholds of the specified **Traffic Type**.

**Traffic Type** can be chosen from **None, Broadcast, Multicast, Destination Lookup Failed (DLF), Broadcast+Multicast, Broadcast+DLF, Multicast+DLF, and Broadcast+Multicast+DLF**.

The Rate is in the range from 1 to 262143. By default, suppress no traffic type.

## 2.9 ACL

ACL(Access Control List) is used to achieve the packet filtering function by the configuration of matching rules and processing operation(s). An ACL is a sequential

collection of permit and deny conditions that apply to packets. When a packet is received on an interface, the switch compares the fields in the packet against any applied ACLs to verify that the packet has the required permissions to be forwarded, based on the criteria specified in the access lists.

There are three types of ACL:

**Basic IP ACL:** filtering packets only based on source IP address.

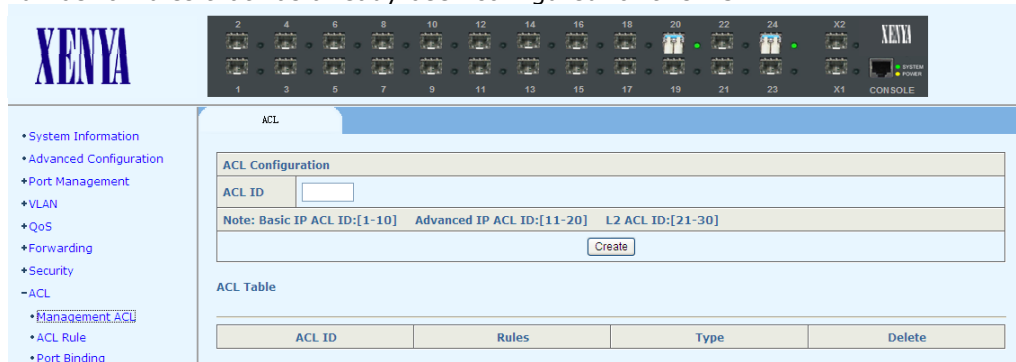

**Advance IP ACL:** filtering packets based on source IP address, destination IP address, IP protocol type, and more.

**L2 ACL:** filtering packets based on source MAC address, destination MAC addresses, 802.1p priority, and L2 protocol type.

## 2.9.1 Management ACL

In order to flexibly configure ACL rule, the ACL ID is divided into three segments: 1-10 for Basic IP ACL, 11-20 for Advanced IP ACL, and 21-30 for L2 ACL. **ACL Rule** page sets different ACL rules based on the range of ACL ID.

The bottom part of this page lists all configured ACL IDs. Parameter **Rules** shows the number of rules that has already been configured for this ACL ID.

## 2.9.2 ACL Rule

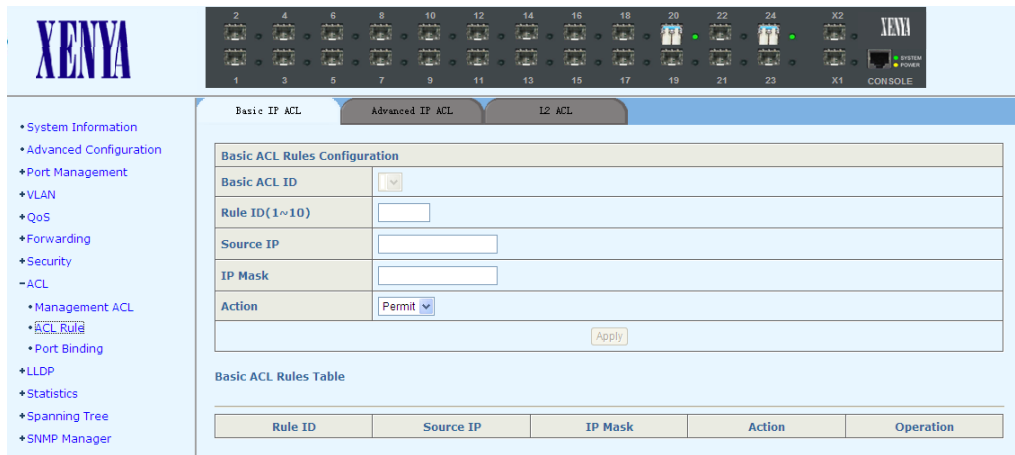

### 2.9.2.1 Basic IP ACL

This page sets Basic IP ACL rule s. Up to 10 rules per ACL ID can be set; each rule ID can only be used once. All parameters, **Rule ACL ID**, **Source IP**, and **IP Mask**, must be set, and the **Action** can be **Permit** or **Deny**.

**Permit:** permit the access of rule matched IP.

**Deny:** Deny the access of rule matched IP.

The bottom part of this page lists all configured Basic IP ACL rules.

### 2.9.2.2 Advanced IP ACL

This page sets ACL rules based on packet Src IP Address, Dst IP Address, IP Protocol type and other protocol features, such as TCP or UDP source port, destination port, ICMP protocol message types etc.

**Rule ID:** identification of the ACL rule.

**Protocol Type:** an existing protocol type such as Icmp, igmp, Udp, Tcp, Ospf, or an interger between 1 and 255.

**Src IP Address:** source host IP address.

**Src IP Mask:** source host IP subnet mask.

**Src L4 Port:** TCP/UDP source port, an existing Echo, Frp, telnet, Sntp, WWW, or an integer between 1 to 65535. It can be set only when protocol type is TCP or UDP.

Note: IETF IANA defines three groups of ports: Well Known Ports (0-1023), Registered Ports (1024-49151), and Dynamic and/or Private Ports (49152-65535).

**Dst IP Address:** destination host IP address.

**Dst IP Mask:** destination host IP subnet mask

**Dst L4 Port:** TCP/UDP destination port, an existing Echo, Frp, telnet, Sntp, WWW, or an integer 1-65535. It can be set only when protocol type is TCP or UDP.

**Action:** permit or deny access of the package with matched rules.

The bottom part of this page lists all configured Advanced IP ACL rules.

The screenshot shows the 'Advanced IP ACL' configuration page. The configuration form includes the following fields:

- Advanced ACL ID: [Dropdown]
- Rule ID (1~10): [Text Input]
- Protocol Type (1~255): [Dropdown]
- Src IP Address: [Text Input: 0.0.0.0]
- Src IP Mask: [Text Input: 255.255.255.255]
- Src L4 Port (1~65535): [Dropdown]
- Dst IP Address: [Text Input: 0.0.0.0]
- Dst IP Mask: [Text Input: 255.255.255.255]
- Dst L4 Port (1~65535): [Dropdown]
- Action: [Dropdown: Permit]

Below the configuration form is the 'Basic ACL Rules Table' with the following columns:

| Rule ID | Protocol Type | Src IP Address | Src IP Mask | Src L4 Port | Dst IP Address | Dst IP Mask | Dst L4 Port | Service Type | Action | Operation |
|---------|---------------|----------------|-------------|-------------|----------------|-------------|-------------|--------------|--------|-----------|
|         |               |                |             |             |                |             |             |              |        |           |

### 2.9.2.3 L2 ACL

This page sets **Src MAC Address, Src MAC Address Mask, Dst Mac Address, and Dst MAC address Mask**, and the **Action** that can be selected as **Permit** or **Deny**.

**Rule ID:** Identification the ACL rule.

**Src MAC Address:** source host mac address.

**Src MAC Address Mask:** source host mac address mask.

**Dst MAC Address:** destination host mac address.

**Dst MAC address Mask:** destination host mac address mask.

**Action:** permit or deny the access for the package with matched rules.

The bottom part of this page lists all configured L2 ACL rules.

The screenshot shows the 'L2 ACL' configuration page. The configuration form includes the following fields:

- L2 ACL ID: [Dropdown]
- Rule ID (1~10): [Text Input]
- Src Mac Address: [Text Input: 00-00-00-00-00-00]
- Src MAC Address Mask: [Text Input: ##-##-##-##-##-##]
- Dst Mac Address: [Text Input: 00-00-00-00-00-00]
- Dst MAC Address Mask: [Text Input: ##-##-##-##-##-##]
- Action: [Dropdown: Permit]

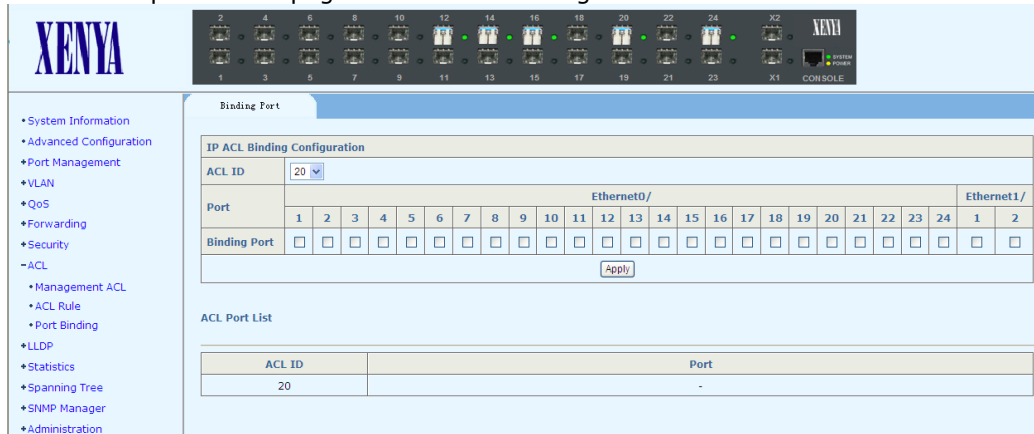

Below the configuration form is the 'Basic ACL Rules Table' with the following columns:

| Rule ID | Src MAC Address | Src MAC Mask | Dst MAC Address | Dst MAC Mask | Action | Operation |
|---------|-----------------|--------------|-----------------|--------------|--------|-----------|
|         |                 |              |                 |              |        |           |

## 2.9.3 Port Binding

This page sets the binding of an Ethernet port to a specified ACL ID. If a port is bound, it will take effect on all the rules associated to this ACL ID.

The bottom part of this page lists all ACL binding Ports.

## 2.10 LLDP

LLDP (Link Layer Discovery Protocol) defines a standard way for an Ethernet device to advertise its information to its network neighbors and to store the information discovered from other devices, as described in IEEE 802.1AB.

### 2.10.1 Management LLDP

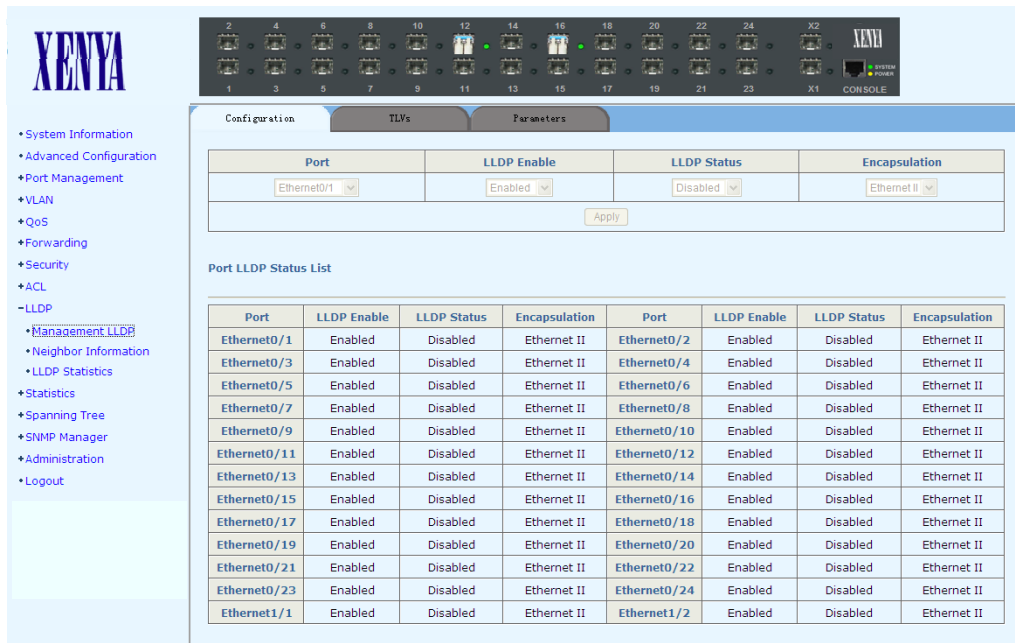

#### 2.10.1.1 Configuration

This page configures LLDP enabling, sets transmit LLDP information mode from **Disabled, Rx and Tx, Tx only, Rx only**, and also specifies the LLDP **Encapsulation** to be **ethernetII** or **SNAP** for a specified Ethernet port.

**EthernetII:** the Ethernet frame of type 0x88cc.

**SNAP:** the Ethernet frame of type 0xAAAA-0300-0000-88CC.

The bottom part of this page lists the LLDP status for all ports.

### 2.10.1.2 TLVs

This page sets the type of transmitted information: **Port Description**, **System Name**, **System Description**, **System Capability**, and **Management**.

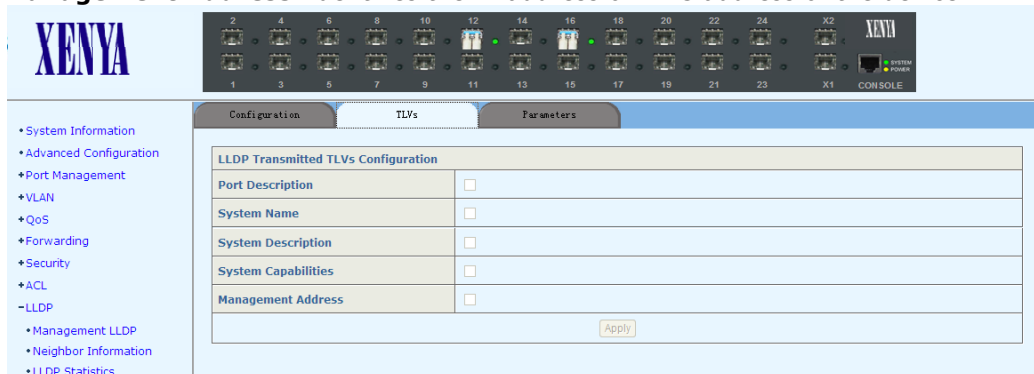

**Port Description:** identifies information of the interface, including the name of manufacturer, product name, and the version of the interface hardware & software.

**System Name:** identifies the administratively-assigned name for the device.

**System Description:** a textual description of the device. This value typically includes the full name and version identification of the system's hardware type, software operating system, and networking software.

**System Capability:** identifies the capabilities of the device and its primary function (e.g. repeater, Bridge, WLAN, Access Point, Router, Telephone, DOCSIS cable device, Station only, etc.)

**Management Address:** identifies the IP address or MAC address of the device.

### 2.10.1.3 Parameters

This page sets LLDP parameters: **Tx Interval**, **Tx Hold**, **Tx Delay**, **Reinit Delay**, and **Fast Count**.

**Tx Interval:** the time interval between sending LLDP packets. The range is from 5 to

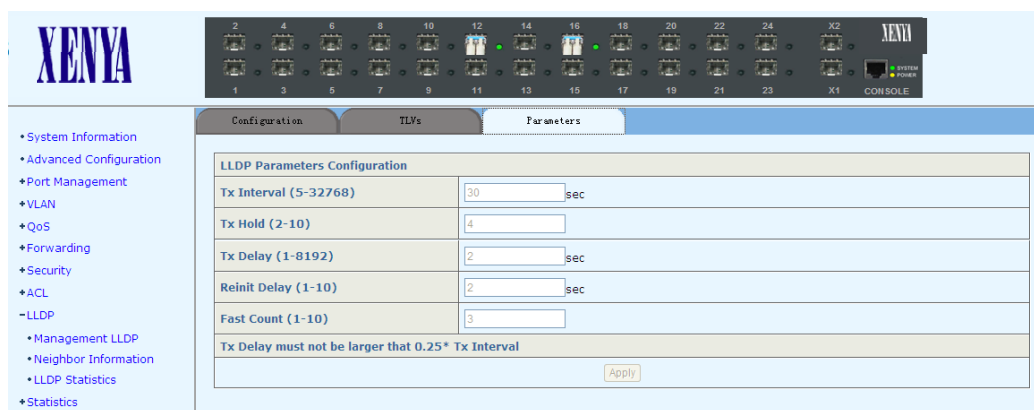

32768 seconds. The default value is 30 seconds.

**Tx Hold:** TTL multiplier. TTL of TLV carried in LLDPDU is used to set the aging time on the neighbor device. Since  $TTL \text{ of TLV} = TTL \text{ multiplier} \times \text{Tx Interval}$ , the aging time on the neighbor device can be adjusted by the TTL multiplier. The range of this value is from 2 to 10, and the default value is 4.

**Tx Delay:** the delay between successive LLDP packets which are initiated by port parameter changes. The range is from 1 to 8192, and the default value is 2.

**Reinit Delay:** in the case of **LLDP Status** mode change, the port will initialize the protocol state machine, and the switch will need to wait for **Reinit Delay** to be able to start the next initialization. The range of this value is from 1 to 10 seconds, and the default value is 2.

**Fast Count:** number of fast sending packets. It is in the range of 1 to 10, and the default value is 3.

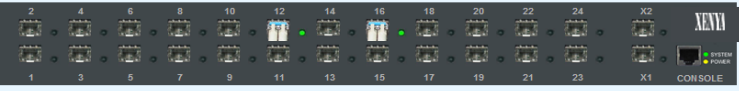

## 2.10.2 Neighbor Information

This page shows the **Local Port**, **Chassis Id** of a local device, and the **Remote Port ID**, **System name**, **Port description**, **System Capabilities**, and **Management Address** of a neighbor device.

## 2.10.3 LLDP Statistics

This page shows the statistics **Tx Frames**, **Rx Frames**, **Rx Error Frames**, **Discarded Frames**, **TLVs discarded**, **TLVs unrecognized**, **Org.TLVs discarded**, and **Age out** packet counts of LLDP packets on each Ethernet port.

LLDP Statistics

| Port         | Tx Frames | Rx Frames | Rx Error Frames | Discarded Frames | TLVs discarded | TLVs unrecognized | Org. TLVs discarded | Aged out |
|--------------|-----------|-----------|-----------------|------------------|----------------|-------------------|---------------------|----------|
| Ethernet0/1  | 0         | 0         | 0               | 0                | 0              | 0                 | 0                   | 0        |
| Ethernet0/2  | 0         | 0         | 0               | 0                | 0              | 0                 | 0                   | 0        |
| Ethernet0/3  | 0         | 0         | 0               | 0                | 0              | 0                 | 0                   | 0        |
| Ethernet0/4  | 0         | 0         | 0               | 0                | 0              | 0                 | 0                   | 0        |
| Ethernet0/5  | 0         | 0         | 0               | 0                | 0              | 0                 | 0                   | 0        |
| Ethernet0/6  | 0         | 0         | 0               | 0                | 0              | 0                 | 0                   | 0        |
| Ethernet0/7  | 0         | 0         | 0               | 0                | 0              | 0                 | 0                   | 0        |
| Ethernet0/8  | 0         | 0         | 0               | 0                | 0              | 0                 | 0                   | 0        |
| Ethernet0/9  | 0         | 0         | 0               | 0                | 0              | 0                 | 0                   | 0        |
| Ethernet0/10 | 0         | 0         | 0               | 0                | 0              | 0                 | 0                   | 0        |
| Ethernet0/11 | 0         | 0         | 0               | 0                | 0              | 0                 | 0                   | 0        |
| Ethernet0/12 | 0         | 0         | 0               | 0                | 0              | 0                 | 0                   | 0        |
| Ethernet0/13 | 0         | 0         | 0               | 0                | 0              | 0                 | 0                   | 0        |
| Ethernet0/14 | 0         | 0         | 0               | 0                | 0              | 0                 | 0                   | 0        |
| Ethernet0/15 | 0         | 0         | 0               | 0                | 0              | 0                 | 0                   | 0        |
| Ethernet0/16 | 0         | 0         | 0               | 0                | 0              | 0                 | 0                   | 0        |
| Ethernet0/17 | 0         | 0         | 0               | 0                | 0              | 0                 | 0                   | 0        |
| Ethernet0/18 | 0         | 0         | 0               | 0                | 0              | 0                 | 0                   | 0        |
| Ethernet0/19 | 0         | 0         | 0               | 0                | 0              | 0                 | 0                   | 0        |
| Ethernet0/20 | 0         | 0         | 0               | 0                | 0              | 0                 | 0                   | 0        |
| Ethernet0/21 | 0         | 0         | 0               | 0                | 0              | 0                 | 0                   | 0        |
| Ethernet0/22 | 0         | 0         | 0               | 0                | 0              | 0                 | 0                   | 0        |
| Ethernet0/23 | 0         | 0         | 0               | 0                | 0              | 0                 | 0                   | 0        |
| Ethernet0/24 | 0         | 0         | 0               | 0                | 0              | 0                 | 0                   | 0        |

## 2.11 Statistics

All the pages in this menu show various statistics information of the switch.

### 2.11.1 Port Status

This page shows the **State**, **Link**, **Negotiation**, **Speed&Duplex**, **Flow Control**, **Learning**, **LBD** of each Ethernet port.

The screenshot shows the XENYA switch management interface. At the top, there is a physical port layout diagram with 24 ports and a console port. Below this, the 'Port Status' page is displayed, featuring a table with the following columns: Port, State, Link, Negotiation, Speed&Duplex, Flow Control, Learning, LBD, and LBD Control. The table lists 24 ports, with most in a 'Down' state and a few in an 'Up' state (ports 12 and 16).

| Port         | State   | Link | Negotiation | Speed&Duplex | Flow Control | Learning | LBD      | LBD Control |
|--------------|---------|------|-------------|--------------|--------------|----------|----------|-------------|
| Ethernet0/1  | Enabled | Down | Auto        | -            | -            | Enabled  | Disabled | Disabled    |
| Ethernet0/2  | Enabled | Down | Auto        | -            | -            | Enabled  | Disabled | Disabled    |
| Ethernet0/3  | Enabled | Down | Auto        | -            | -            | Enabled  | Disabled | Disabled    |
| Ethernet0/4  | Enabled | Down | Auto        | -            | -            | Enabled  | Disabled | Disabled    |
| Ethernet0/5  | Enabled | Down | Auto        | -            | -            | Enabled  | Disabled | Disabled    |
| Ethernet0/6  | Enabled | Down | Auto        | -            | -            | Enabled  | Disabled | Disabled    |
| Ethernet0/7  | Enabled | Down | Auto        | -            | -            | Enabled  | Disabled | Disabled    |
| Ethernet0/8  | Enabled | Down | Auto        | -            | -            | Enabled  | Disabled | Disabled    |
| Ethernet0/9  | Enabled | Down | Auto        | -            | -            | Enabled  | Disabled | Disabled    |
| Ethernet0/10 | Enabled | Down | Auto        | -            | -            | Enabled  | Disabled | Disabled    |
| Ethernet0/11 | Enabled | Down | Auto        | -            | -            | Enabled  | Disabled | Disabled    |
| Ethernet0/12 | Enabled | Up   | Auto        | 1000M Full   | Off          | Enabled  | Disabled | Disabled    |
| Ethernet0/13 | Enabled | Down | Auto        | -            | -            | Enabled  | Disabled | Disabled    |
| Ethernet0/14 | Enabled | Down | Auto        | -            | -            | Enabled  | Disabled | Disabled    |
| Ethernet0/15 | Enabled | Down | Auto        | -            | -            | Enabled  | Disabled | Disabled    |
| Ethernet0/16 | Enabled | Up   | Auto        | 100M Full    | Off          | Enabled  | Disabled | Disabled    |
| Ethernet0/17 | Enabled | Down | Auto        | -            | -            | Enabled  | Disabled | Disabled    |
| Ethernet0/18 | Enabled | Down | Auto        | -            | -            | Enabled  | Disabled | Disabled    |

### 2.11.2 Port Statistics

This page shows the **TxGoodPkts**, **TxBadPkts**, **RxGoodPkts**, **RxBadPkts**, **TxAabort**, **Collision**, and **DropPkt** of each Ethernet port.

**TxGoodPkts:** the total number of outgoing normal packets on the port, including outgoing normal packets and normal pause frames.

**TxBadPkts:** the total byte number of outgoing error frames.

**RxGoodPkts:** the total number of incoming normal packets on the port, including incoming normal packets and normal pause frames.

**RxBadPkts:** the total byte number of incoming error frames.

**TxAabort:** the number of transmission failures due to various reasons, such as collisions.

**Collision:** the number of detected collisions.

**DropPkt:** the number of packets dropped for various reasons.

**Port Statistics**

| Port         | TxGoodPkts | TxBadPkts | RxGoodPkts | RxBadPkts | TxAbort | Collision | DropPkt |
|--------------|------------|-----------|------------|-----------|---------|-----------|---------|
| Ethernet0/1  | 0          | 0         | 0          | 0         | 0       | 0         | 0       |
| Ethernet0/2  | 0          | 0         | 0          | 0         | 0       | 0         | 0       |
| Ethernet0/3  | 0          | 0         | 0          | 0         | 0       | 0         | 0       |
| Ethernet0/4  | 0          | 0         | 0          | 0         | 0       | 0         | 0       |
| Ethernet0/5  | 0          | 0         | 0          | 0         | 0       | 0         | 0       |
| Ethernet0/6  | 0          | 0         | 0          | 0         | 0       | 0         | 0       |
| Ethernet0/7  | 0          | 0         | 0          | 0         | 0       | 0         | 0       |
| Ethernet0/8  | 0          | 0         | 0          | 0         | 0       | 0         | 0       |
| Ethernet0/9  | 0          | 0         | 0          | 0         | 0       | 0         | 0       |
| Ethernet0/10 | 0          | 0         | 0          | 0         | 0       | 0         | 0       |
| Ethernet0/11 | 0          | 0         | 0          | 0         | 0       | 0         | 0       |
| Ethernet0/12 | 10849      | 0         | 8225       | 0         | 0       | 0         | 0       |
| Ethernet0/13 | 0          | 0         | 0          | 0         | 0       | 0         | 0       |
| Ethernet0/14 | 0          | 0         | 0          | 0         | 0       | 0         | 0       |
| Ethernet0/15 | 0          | 0         | 0          | 0         | 0       | 0         | 0       |
| Ethernet0/16 | 11596      | 0         | 11450      | 0         | 0       | 0         | 0       |
| Ethernet0/17 | 0          | 0         | 0          | 0         | 0       | 0         | 0       |
| Ethernet0/18 | 0          | 0         | 0          | 0         | 0       | 0         | 0       |
| Ethernet0/19 | 0          | 0         | 0          | 0         | 0       | 0         | 0       |
| Ethernet0/20 | 0          | 0         | 0          | 0         | 0       | 0         | 0       |
| Ethernet0/21 | 0          | 0         | 0          | 0         | 0       | 0         | 0       |
| Ethernet0/22 | 0          | 0         | 0          | 0         | 0       | 0         | 0       |
| Ethernet0/23 | 0          | 0         | 0          | 0         | 0       | 0         | 0       |
| Ethernet0/24 | 0          | 0         | 0          | 0         | 0       | 0         | 0       |

### 2.11.3 VLAN List

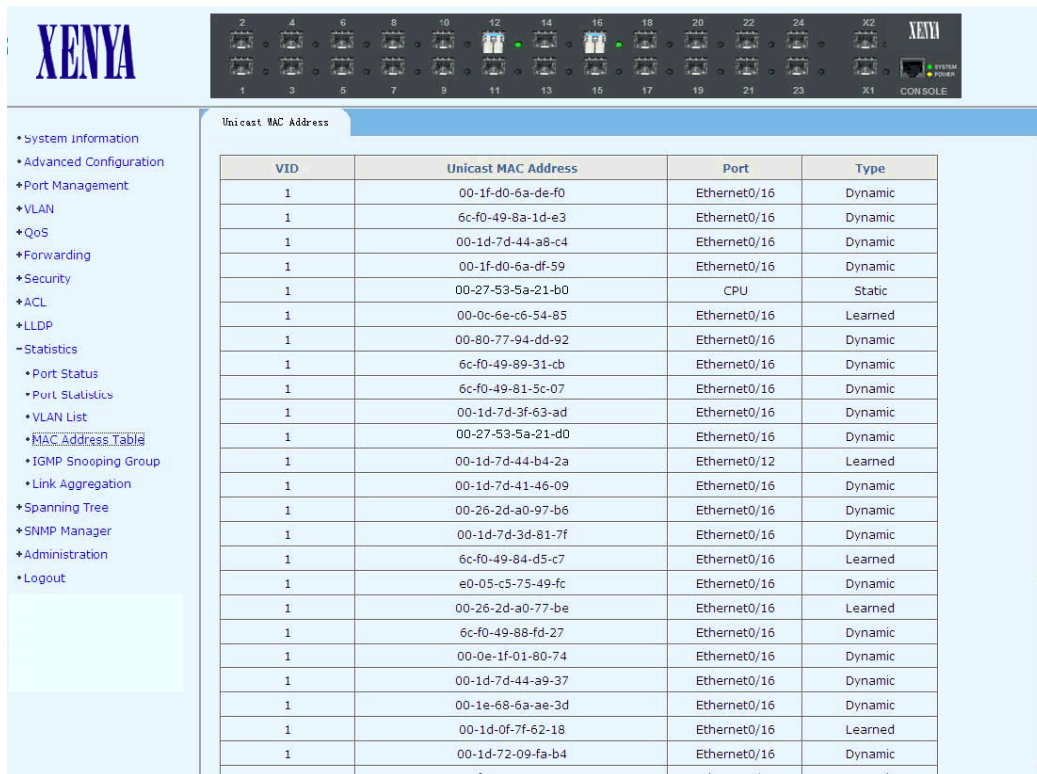

This page lists the information of all VLANs, including **VID**, **Name**, **Type**, **Tagged**, **Untagged**, and **Forbidden**. **Type** includes **Static** or **Dynamic**. **Tagged** lists all ports out of which packets are sent tagged, **Untagged** lists all ports out of which packets are sent untagged, and **Forbidden** lists all ports that cannot be added to the VLAN group.

**VLAN List**

| VID | Name     | Type     | Tagged | Untagged                     | Forbidden |
|-----|----------|----------|--------|------------------------------|-----------|
| 1   | Default  | Static   | -      | Ethernet0/1-24,Ethernet1/1-2 | -         |
| 1   | Mvr vlan | Mvr vlan | -      | -                            | -         |

### 2.11.4 MAC Address Table

This page shows information of MAC address entries in the MAC address table, including **VID**, **Unicast MAC Address**, **Port**, and **Type**. **Type** includes **Dynamic**, **Static**, **Blackhole** or **Learned**.

### 2.11.5 IGMP Snooping Group

This page shows IGMP Snooping multicast group information, including **VID**, **Multicast Group**, **MAC Address**, and **Member Ports**. **Multicast Group** is the IP address of a multicast group, **MAC Address** is the address of a MAC multicast group, and **Member Ports** include all ports belonging to this IGMP Snooping group.

### 2.11.6 Link Aggregation

There are three tag pages on this webpage.

**Manual Trunking Group:** shows manual trunk information, including **Trunk ID**, **Trunk Name**, **Type**, and **Port List**. **Type** is fixed to **Manual**.

**Static Trunking Group:** shows static trunk information, including **Trunk ID**, **Trunk Name**, **Type**, and **Port List**. **Type** is fixed to **Static**.

**LACP Trunking Group:** shows LACP trunk information, including **Priority**, **MAC** of Actor and Partner. It also shows the **Key**, priority, **Active** state of member ports.

## 2.12 Spanning Tree

Spanning Tree Protocol (STP) is a standard protocol described in IEEE 802.1D. Rapid Spanning Tree Protocol (RSTP, IEEE 802.1w) is an evolution of the 802.1D. Multiple Spanning Tree Protocol (MSTP, IEEE 802.1s) is also an evolution of the 802.1D.

### 2.12.1 Global

Before configuring STP, make sure STP is enabled (see section 2.2 of this manual for details). There is one tag page:

#### 2.12.1.1 Configuration

This page sets bridge configurations: **Mode**, **Max Hops**, **Hello Time**, **Max Age**, **Forward Delay Time**, **Priority**, and **BPDU Guard**.

**Mode:** Three spanning tree modes are supported: stp, rstp, and mstp.

**Max Hops:** this value is in the range from 1 to 20, and is 20 by default.

This parameter is used in MSTP mode only to limit the size of MST domain, and the root switch of the instance always sends a BPDU (or M-record) with a cost of 0 and the hop count of the maximum value. When a switch receives this BPDU, it decrements the received remaining hop count by one and propagates this value as the remaining hop count in the BPDUs it generates. When the count reaches zero, the switch discards the BPDU and ages the information held for the port. By default, this value is set to 20.

**Hello Time:** this value is in the range from 1 to 10 seconds, and is 2 seconds by default. A root bridge regularly sends out configuration BPDUs to maintain the stability of the existing spanning tree. If the switch does not receive a BPDU packet in a specified period,

the spanning tree will be recalculated at BPDU packet times out. When a switch becomes a root bridge, it regularly sends BPDUs at the interval specified by this hello time. A non-root-bridge switch adopts the interval specified by this hello time.

**Max Age:** this value is in the range from 6 to 40 seconds, and is 20 seconds by default. MSTP is capable of detecting link failures and automatically restoring redundant links to the forwarding state. In CIST, switches use max age parameter to determine whether a received configuration BPDU times out. Spanning trees will be recalculated if a configuration BPDU received by a port times out.

**Forward Delay Time:** this value is in the range from 4 to 30 seconds, and is 15 seconds by default.

To prevent the occurrence of a temporary loop, when a port changes its state from discarding to forwarding, it undergoes an intermediate state and waits for a specific period of time to synchronize with the state transition of the remote switches. This state transition period is determined by **Forward Delay Time** configured on the root bridge, and applies to all non-root bridges.

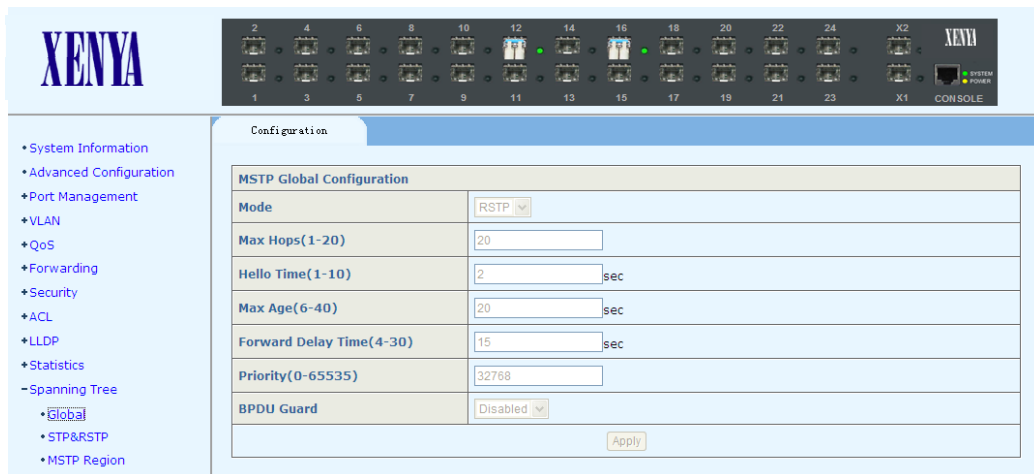

As for the configuration of **Hello Time, Forward Delay Time, and Max Age**, the following formulas must be met to prevent frequent network jitter:

$2 \times (\text{Forward Delay Time} - 1 \text{ second}) \geq \text{Max Age}$ , and  $\text{Max Age} \geq 2 \times (\text{Hello Time} + 1 \text{ second})$ .

**Priority:** this value is in the range from 0 to 65535, and is 32768 by default. This parameter is used in STP and RSTP modes only.

**BPDU Guard:** some ports are usually configured as edge ports to achieve rapid transition, while they will resume non-edge ports automatically upon receiving configuration BPDUs, which may cause spanning trees regeneration and network topology jitter.

Normally, no configuration BPDU will reach edge ports, but malicious users can attack a network by sending configuration BPDUs deliberately to edge ports to cause network jitter, which can be prevented by utilizing this BPDU protection function. With this function enabled on a switch, the switch shuts down the edge ports that receive configuration BPDUs and then reports the cases to the network administrator. After a port is shut down, only the administrator can restore it. By default, the BPDU protection function is disabled.

## 2.12.2 STP&RSTP

### 2.12.2.1 Ports Configuration

This page sets STP enabling, Edge Port, P2P, Migration, Tx Hold Count, External Cost,

Priority, and Root Guard for each port, and also can set Path Cost and Priority.

**Edge Port:** selects **Enabled** to configure the specified Ethernet port as an edge port. By default, all Ethernet ports are non-edge ports.

An edge port is such a port that is directly connected to a user terminal instead of another switch or network segment. Rapid transition to the forwarding state is applied to edge ports, because no loop can be incurred by network topology change on edge ports. The spanning tree protocol allows a port to enter the forwarding state rapidly by setting it to be an edge port, and it is recommended to configure the Ethernet ports connected directly to user terminals as edge ports, so that they may enter the forwarding state immediately.

Normally, configuration BPDUs cannot reach an edge port because the port is not connected to another switch. But, in case that BPDU guard function is disabled on an edge port, configuration BPDUs sent deliberately by a malicious user may reach the port. If an edge port receives a BPDU, it changes itself to be a non-edge port.

**P2P:** choose from **Force\_True**, **Force\_False**, and **Auto**.

**Force\_True:** specifies that the link connected to the specified Ethernet port is a point-to-point link.

**Force\_False:** specifies that the link connected to the specified Ethernet port is not a point-to-point link.

**Auto:** specified to automatically determine whether the link connected to the specified Ethernet port is a point-to-point link.

**Protocol Migration:** For backward compatibility with switches running 802.1d, RSTP selectively sends 802.1d configuration BPDUs and TCN BPDUs on per-port basis.

When a port is initialized, the migration-delay timer is started, and RSTP BPDUs are sent in this time interval. When this timer is active, the switch processes all BPDUs received on the port and ignores the protocol type.

If the switch receives an 802.1d BPDU after the port's migration-delay timer is expired, it assumes that it is connected to an 802.1d switch and starts using only 802.1d BPDUs. However, if the RSTP switch is using 802.1d BPDUs on a port and receives an RSTP BPDU after the timer is timed out, it restarts the timer and starts using RSTP BPDUs on that port.

**Tx Hold Count:** the maximum number of configuration BPDUs a port can send in each Hello time. This argument ranges from 1 to 10 and is 3 by default.

**External Cost:** sets the path cost of the specified port. It is in the range of 1 to 200000000, the default value is 0 (Auto).

**Priority:** port priority, it is in the range of 0 to 255; the default value is 128.

**Root Guard:** by default, the root protection function is disabled.

Due to configuration error or malicious attack, the root bridge in the network may receive configuration BPDUs with priorities higher than that of a root bridge, which will cause a new root bridge to be elected and network topology jitter will occur. In this case, data flows that should have been transmitted along a high-speed link may be led to a low-speed link.

This problem can be resolved by enabling the root protection function. Root-protection-enabled ports can only be kept as designated ports. When a port of this type receives configuration BPDUs with higher priorities, that is, when it is to become a non-designated port, it turns to the discarding state and stops forwarding packets (as if it were disconnected from the link).

**Ports Configuration**

| Port        | STP      | Edge Port | P2P  | Migration | Tx Hold Count | External Cost (0 =Auto) | Priority | Root Guard |
|-------------|----------|-----------|------|-----------|---------------|-------------------------|----------|------------|
| Ethernet0/1 | Disabled | Disabled  | Auto | Disabled  | 3             | 20000                   | 128      | Disabled   |

**STP&RSTP Port Attributes**

| Port         | STP      | Edge Port | P2P  | Migration | Tx Hold Count | External Cost | Priority | Root Guard |
|--------------|----------|-----------|------|-----------|---------------|---------------|----------|------------|
| Ethernet0/1  | Disabled | Disabled  | Auto | Disabled  | 3             | 20000         | 128      | Disabled   |
| Ethernet0/2  | Disabled | Disabled  | Auto | Disabled  | 3             | 20000         | 128      | Disabled   |
| Ethernet0/3  | Disabled | Disabled  | Auto | Disabled  | 3             | 20000         | 128      | Disabled   |
| Ethernet0/4  | Disabled | Disabled  | Auto | Disabled  | 3             | 20000         | 128      | Disabled   |
| Ethernet0/5  | Disabled | Disabled  | Auto | Disabled  | 3             | 20000         | 128      | Disabled   |
| Ethernet0/6  | Disabled | Disabled  | Auto | Disabled  | 3             | 20000         | 128      | Disabled   |
| Ethernet0/7  | Disabled | Disabled  | Auto | Disabled  | 3             | 20000         | 128      | Disabled   |
| Ethernet0/8  | Disabled | Disabled  | Auto | Disabled  | 3             | 20000         | 128      | Disabled   |
| Ethernet0/9  | Disabled | Disabled  | Auto | Disabled  | 3             | 20000         | 128      | Disabled   |
| Ethernet0/10 | Disabled | Disabled  | Auto | Disabled  | 3             | 20000         | 128      | Disabled   |
| Ethernet0/11 | Disabled | Disabled  | Auto | Disabled  | 3             | 20000         | 128      | Disabled   |
| Ethernet0/12 | Disabled | Disabled  | Auto | Disabled  | 3             | 20000         | 128      | Disabled   |
| Ethernet0/13 | Disabled | Disabled  | Auto | Disabled  | 3             | 20000         | 128      | Disabled   |
| Ethernet0/14 | Disabled | Disabled  | Auto | Disabled  | 3             | 20000         | 128      | Disabled   |
| Ethernet0/15 | Disabled | Disabled  | Auto | Disabled  | 3             | 20000         | 128      | Disabled   |
| Ethernet0/16 | Disabled | Disabled  | Auto | Disabled  | 3             | 20000         | 128      | Disabled   |

### 2.12.2.2 Ports State

This page lists all port parameters and spanning tree information, including **STP, State, Priority, Cost, Role, Designated Port ID, Designated Root ID, and Designated Bridge ID.**

**Ports State**

| Port         | STP      | State      | Priority | Cost | Role     | Designated Port ID | Designated Root ID   | Designated Bridge ID |
|--------------|----------|------------|----------|------|----------|--------------------|----------------------|----------------------|
| Ethernet0/1  | Disabled | Forwarding | 128      | 0    | Disabled | 0-0                | 65535:ff-ff-ff-ff-ff | 0:00-00-00-00-00-00  |
| Ethernet0/2  | Disabled | Forwarding | 128      | 0    | Disabled | 0-0                | 65535:ff-ff-ff-ff-ff | 0:00-00-00-00-00-00  |
| Ethernet0/3  | Disabled | Forwarding | 128      | 0    | Disabled | 0-0                | 65535:ff-ff-ff-ff-ff | 0:00-00-00-00-00-00  |
| Ethernet0/4  | Disabled | Forwarding | 128      | 0    | Disabled | 0-0                | 65535:ff-ff-ff-ff-ff | 0:00-00-00-00-00-00  |
| Ethernet0/5  | Disabled | Forwarding | 128      | 0    | Disabled | 0-0                | 65535:ff-ff-ff-ff-ff | 0:00-00-00-00-00-00  |
| Ethernet0/6  | Disabled | Forwarding | 128      | 0    | Disabled | 0-0                | 65535:ff-ff-ff-ff-ff | 0:00-00-00-00-00-00  |
| Ethernet0/7  | Disabled | Forwarding | 128      | 0    | Disabled | 0-0                | 65535:ff-ff-ff-ff-ff | 0:00-00-00-00-00-00  |
| Ethernet0/8  | Disabled | Forwarding | 128      | 0    | Disabled | 0-0                | 65535:ff-ff-ff-ff-ff | 0:00-00-00-00-00-00  |
| Ethernet0/9  | Disabled | Forwarding | 128      | 0    | Disabled | 0-0                | 65535:ff-ff-ff-ff-ff | 0:00-00-00-00-00-00  |
| Ethernet0/10 | Disabled | Forwarding | 128      | 0    | Disabled | 0-0                | 65535:ff-ff-ff-ff-ff | 0:00-00-00-00-00-00  |
| Ethernet0/11 | Disabled | Forwarding | 128      | 0    | Disabled | 0-0                | 65535:ff-ff-ff-ff-ff | 0:00-00-00-00-00-00  |
| Ethernet0/12 | Disabled | Forwarding | 128      | 0    | Disabled | 0-0                | 65535:ff-ff-ff-ff-ff | 0:00-00-00-00-00-00  |
| Ethernet0/13 | Disabled | Forwarding | 128      | 0    | Disabled | 0-0                | 65535:ff-ff-ff-ff-ff | 0:00-00-00-00-00-00  |
| Ethernet0/14 | Disabled | Forwarding | 128      | 0    | Disabled | 0-0                | 65535:ff-ff-ff-ff-ff | 0:00-00-00-00-00-00  |
| Ethernet0/15 | Disabled | Forwarding | 128      | 0    | Disabled | 0-0                | 65535:ff-ff-ff-ff-ff | 0:00-00-00-00-00-00  |
| Ethernet0/16 | Disabled | Forwarding | 128      | 0    | Disabled | 0-0                | 65535:ff-ff-ff-ff-ff | 0:00-00-00-00-00-00  |
| Ethernet0/17 | Disabled | Forwarding | 128      | 0    | Disabled | 0-0                | 65535:ff-ff-ff-ff-ff | 0:00-00-00-00-00-00  |
| Ethernet0/18 | Disabled | Forwarding | 128      | 0    | Disabled | 0-0                | 65535:ff-ff-ff-ff-ff | 0:00-00-00-00-00-00  |
| Ethernet0/19 | Disabled | Forwarding | 128      | 0    | Disabled | 0-0                | 65535:ff-ff-ff-ff-ff | 0:00-00-00-00-00-00  |
| Ethernet0/20 | Disabled | Forwarding | 128      | 0    | Disabled | 0-0                | 65535:ff-ff-ff-ff-ff | 0:00-00-00-00-00-00  |
| Ethernet0/21 | Disabled | Forwarding | 128      | 0    | Disabled | 0-0                | 65535:ff-ff-ff-ff-ff | 0:00-00-00-00-00-00  |
| Ethernet0/22 | Disabled | Forwarding | 128      | 0    | Disabled | 0-0                | 65535:ff-ff-ff-ff-ff | 0:00-00-00-00-00-00  |
| Ethernet0/23 | Disabled | Forwarding | 128      | 0    | Disabled | 0-0                | 65535:ff-ff-ff-ff-ff | 0:00-00-00-00-00-00  |
| Ethernet0/24 | Disabled | Forwarding | 128      | 0    | Disabled | 0-0                | 65535:ff-ff-ff-ff-ff | 0:00-00-00-00-00-00  |

### 2.12.2.3 Bridge Information

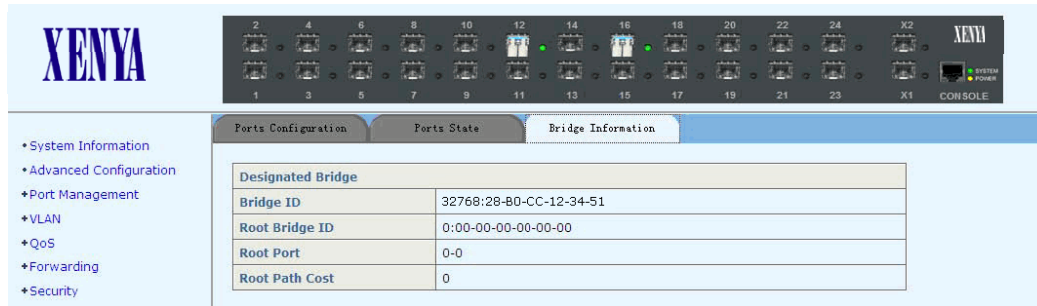

This page lists basic information of **Designated Bridge**, including **Bridge ID**, **Root Bridge ID**, **Root Port**, and **Root Path Cost**.

**Bridge ID:** ID of this switch.

**Root Bridge ID:** ID of the root bridge.

**Root Port:** the spanning tree root port.

**Root Path Cost:** cost of the path from the switch to the root bridge.

### 2.12.3 MSTP Region

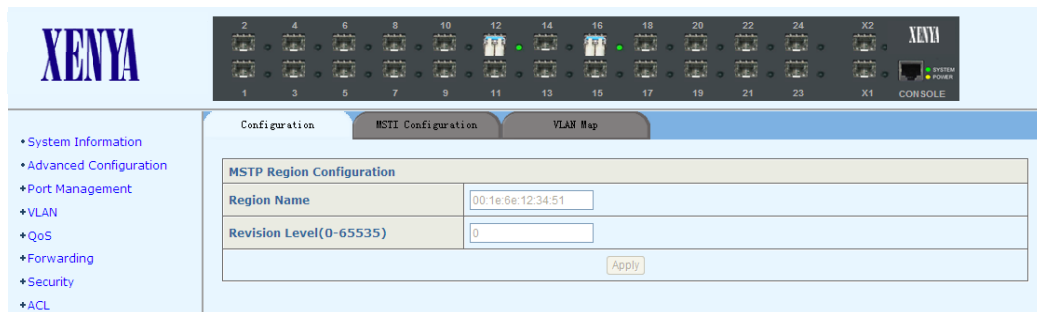

An MSTP region comprises of one or more MST Bridges with the same MSTP configuration identifier.

#### 2.12.3.1 Configuration

This page sets **Region Name** and **Revision level** of MST configuration Identifiers.

**Region Name:** a variable length text string of up to 32 octets

**Revision level:** a 2-octet unsigned integer. It ranges from 0 to 65535.

#### 2.12.3.2 MSTI Configuration

This page sets **MSTI ID**, **MSTI Admin**, and **Priority** for each MST instance.

**MSTI ID:** MSTI identification, ranging from 0 to 15.

**MSTI Admin:** enable or disable the specified instance.

**Priority:** sets a priority for the specified instance. It is in the range from 0 to 65535; the default value is 32768.

The bottom part of this page lists all MST instances information.

**MSTI Configuration**

MSTI ID: 0

MSTI Admin: Enabled

Priority(0-65535, with mod(priority, 4096)=0): 32768

Apply

**MSTI Priority List**

| MSTI ID | Admin    | Priority |
|---------|----------|----------|
| 0       | Enabled  | 32768    |
| 1       | Disabled | 32768    |
| 2       | Disabled | 32768    |
| 3       | Disabled | 32768    |
| 4       | Disabled | 32768    |
| 5       | Disabled | 32768    |
| 6       | Disabled | 32768    |
| 7       | Disabled | 32768    |
| 8       | Disabled | 32768    |
| 9       | Disabled | 32768    |
| 10      | Disabled | 32768    |
| 11      | Disabled | 32768    |
| 12      | Disabled | 32768    |
| 13      | Disabled | 32768    |
| 14      | Disabled | 32768    |
| 15      | Disabled | 32768    |

### 2.12.3.3 VLAN MAP

This page maps one or more VLANs into a specific MST instance. One or more VLANs can be assigned to a spanning-tree instance at a time.

The bottom part of this page lists the VLAN mapping table.

**VLAN Map**

MSTI ID: 0

VLAN ID(1-4094, eg:2,4,6-12): 1-4094

Apply

**MSTI VLAN Map List**

| MSTI ID | Map VLAN |
|---------|----------|
| 0       | 1-4094   |
| 1       | -        |
| 2       | -        |
| 3       | -        |
| 4       | -        |
| 5       | -        |
| 6       | -        |
| 7       | -        |
| 8       | -        |
| 9       | -        |
| 10      | -        |
| 11      | -        |
| 12      | -        |
| 13      | -        |
| 14      | -        |
| 15      | -        |

## 2.12.4 MSTP Ports

### 2.12.4.1 Configuration

This page enables **Admin**, **Edge Port**, **P2P**, and **External Cost** for each port. Similar to STP and RSTP port configuration described in section 2.12.2.1 Ports Configuration, this page sets MSTP port configuration. The bottom part of this page lists the MSTP attributes for each port.

The screenshot shows the configuration page for MSTP Ports. At the top, there is a status bar with port indicators from 2 to 24, X1, and X2. The main configuration area is titled 'MSTP Ports' and contains a form for configuring a specific port (Ethernet0/1). The form has five fields: Port (dropdown), Admin (Disabled), Edge Port (Disabled), P2P (Auto), and External Cost (20000). Below the form is a table titled 'MSTP Port Attributes' listing all ports from Ethernet0/1 to Ethernet0/18 with their respective configurations.

| Port         | Admin    | Edge Port | P2P  | External Cost |
|--------------|----------|-----------|------|---------------|
| Ethernet0/1  | Disabled | Disabled  | Auto | 20000         |
| Ethernet0/2  | Disabled | Disabled  | Auto | 20000         |
| Ethernet0/3  | Disabled | Disabled  | Auto | 20000         |
| Ethernet0/4  | Disabled | Disabled  | Auto | 20000         |
| Ethernet0/5  | Disabled | Disabled  | Auto | 20000         |
| Ethernet0/6  | Disabled | Disabled  | Auto | 20000         |
| Ethernet0/7  | Disabled | Disabled  | Auto | 20000         |
| Ethernet0/8  | Disabled | Disabled  | Auto | 20000         |
| Ethernet0/9  | Disabled | Disabled  | Auto | 20000         |
| Ethernet0/10 | Disabled | Disabled  | Auto | 20000         |
| Ethernet0/11 | Disabled | Disabled  | Auto | 20000         |
| Ethernet0/12 | Disabled | Disabled  | Auto | 20000         |
| Ethernet0/13 | Disabled | Disabled  | Auto | 20000         |
| Ethernet0/14 | Disabled | Disabled  | Auto | 20000         |
| Ethernet0/15 | Disabled | Disabled  | Auto | 20000         |
| Ethernet0/16 | Disabled | Disabled  | Auto | 20000         |
| Ethernet0/17 | Disabled | Disabled  | Auto | 20000         |
| Ethernet0/18 | Disabled | Disabled  | Auto | 20000         |

### 2.12.4.2 MSTI Ports

This page sets the **Internal Cost** and **Priority** for each MST instance.

**Internal Cost:** sets the path cost of the specified port in a specified MST instance. It is in the range from 1 to 200000000, and the default value is 0 (Auto).

**Priority:** sets the port priority for the specified port in a specified MST instance. It is in the range from 0 to 240, and the default value is 128.

The bottom part of this page lists port parameters and spanning tree information for each MST instance.

The screenshot shows the 'MSTI Ports' configuration page. The form includes fields for MSTI ID (0), Port (Ethernet0/1), Internal Cost (0), and Priority (128). Below the form is a table titled 'MSTP Port Attributes' with the following data:

| MS11 ID | Port         | Internal Path Cost | Priority | Role     | State      | Designated Bridge ID    | Designated Port ID |
|---------|--------------|--------------------|----------|----------|------------|-------------------------|--------------------|
| 0       | Ethernet0/1  | 0                  | 128      | Disablec | Disabled   | 32768:28-80-CC-12-34-51 | 0-0                |
| 0       | Ethernet0/2  | 0                  | 128      | Disablec | Disabled   | 32768:28-80-CC-12-34-51 | 0-0                |
| 0       | Ethernet0/3  | 0                  | 128      | Disablec | Disabled   | 32768:28-80-CC-12-34-51 | 0-0                |
| 0       | Ethernet0/4  | 0                  | 128      | Disablec | Disabled   | 32768:28-80-CC-12-34-51 | 0-0                |
| 0       | Ethernet0/5  | 0                  | 128      | Disablec | Disabled   | 32768:28-80-CC-12-34-51 | 0-0                |
| 0       | Ethernet0/6  | 0                  | 128      | Disablec | Disabled   | 32768:28-80-CC-12-34-51 | 0-0                |
| 0       | Ethernet0/7  | 0                  | 128      | Disablec | Disabled   | 32768:28-80-CC-12-34-51 | 0-0                |
| 0       | Ethernet0/8  | 0                  | 128      | Disablec | Disabled   | 32768:28-80-CC-12-34-51 | 0-0                |
| 0       | Ethernet0/9  | 0                  | 128      | Disablec | Disabled   | 32768:28-80-CC-12-34-51 | 0-0                |
| 0       | Ethernet0/10 | 0                  | 128      | Disablec | Disablec   | 32768:28-80-CC-12-34-51 | 0-0                |
| 0       | Ethernet0/11 | 0                  | 128      | Disablec | Disabled   | 32768:28-80-CC-12-34-51 | 0-0                |
| 0       | Ethernet0/12 | 0                  | 128      | Disablec | Forwarding | 32768:28-80-CC-12-34-51 | 0-0                |
| 0       | Ethernet0/13 | 0                  | 128      | Disablec | Disabled   | 32768:28-80-CC-12-34-51 | 0-0                |
| 0       | Ethernet0/14 | 0                  | 128      | Disablec | Disabled   | 32768:28-80-CC-12-34-51 | 0-0                |
| 0       | Ethernet0/15 | 0                  | 128      | Disablec | Disabled   | 32768:28-80-CC-12-34-51 | 0-0                |

## 2.12.5 MSTP State

This page lists spanning tree information: **Bridge ID**, **Root Bridge ID**, **External Path Cost**, **Internal Path Cost**, and **Root Port** for each MST instance.

The screenshot shows the 'MSTP' summary page with the following table:

| MSTI ID | Bridge ID               | Root Bridge ID      | External Path Cost | Internal Path Cost | Root Port |
|---------|-------------------------|---------------------|--------------------|--------------------|-----------|
| 0       | 32768:28-80-CC-12-34-51 | 0:00-00-00-00-00-00 | 0                  | 0                  | 0-0       |

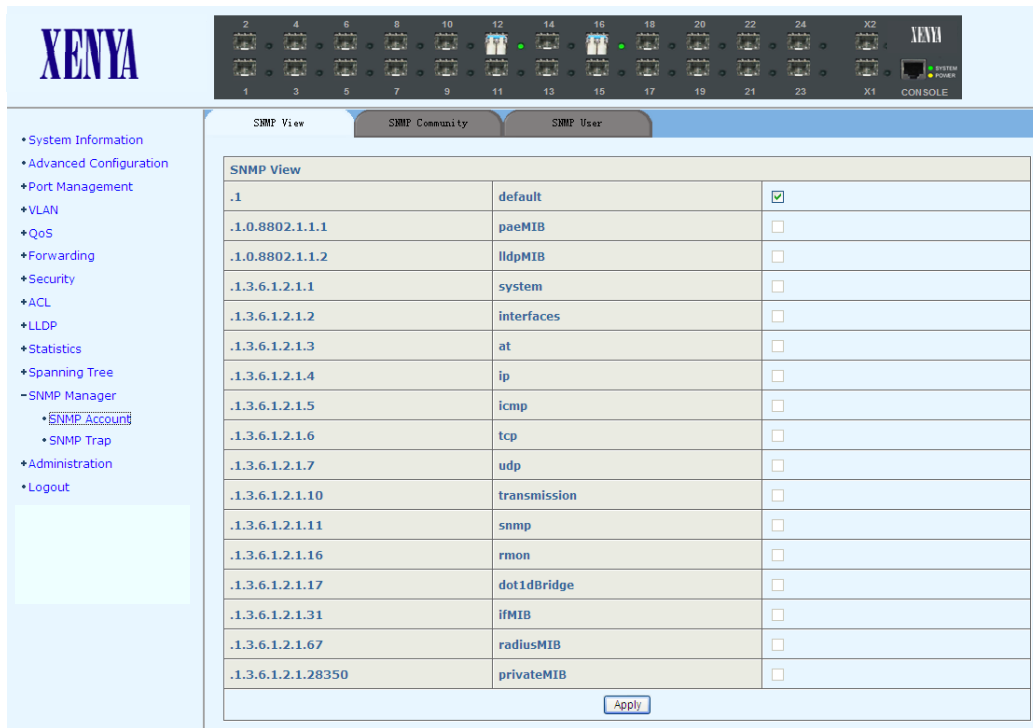

## 2.13 SNMP Manager

### 2.13.1 SNMP Account

There are three tag pages: *SNMP View*, *SNMP Community*, and *SNMP User*.

#### 2.13.1.1 SNMP View

This page sets which tree of SNMP-OID can be managed by an SNMP agent user; the default is all of them. For details of which MIBs are supported, please check section 6 "Appendix B: Supported MIBs" of this manual.

### 2.13.1.2 SNMP Community

This page sets **SNMP Version** between **v1** and **v2c**; **Community Name**, and **Privilege** between **RO** and **RW**.

**v1**: creates an SNMPv1 user.

**v2c**: creates an SNMPv2c user.

**Community Name**: name of the community to be created. It is a string of 3 to 16 characters.

**RO**: specifies that the community to be created has read-only permission to MIB objects. Communities of this type can only query MIBs for device information.

**RW**: specifies that the community to be created has read-write permission to MIB objects. Communities of this type are capable of configuring devices.

The bottom part of this page lists all existing SNMP v1 and v2c communities, including **SNMP Version**, **Community Name**, and **Privilege**. A community can be deleted.

### 2.13.1.3 SNMP User

This page creates a SNMP v3 user, and sets **USM User, Privilege, SNMP V3 Encryption, Auth Algorithm, Auth Password, Privacy Algorithm, and Privacy Password**.

**USM User:** username, a string of 3 to 16 characters.

**Auth Algorithm:** specifies the security mode of authentication. If **SNMP V3 Encryption** is not selected, neither authentication nor encryption will be performed.

**MD5:** uses HMAC MD5 algorithm for authentication.

**SHA:** uses HMAC SHA algorithm for authentication, which is more secure than MD5.

**Auth Password:** Authentication password, a string of 9 to 15 characters in plain text, a 32-bit hexadecimal number in cipher text if MD5 algorithm is used, and a 40-bit hexadecimal number in cipher text if SHA algorithm is used.

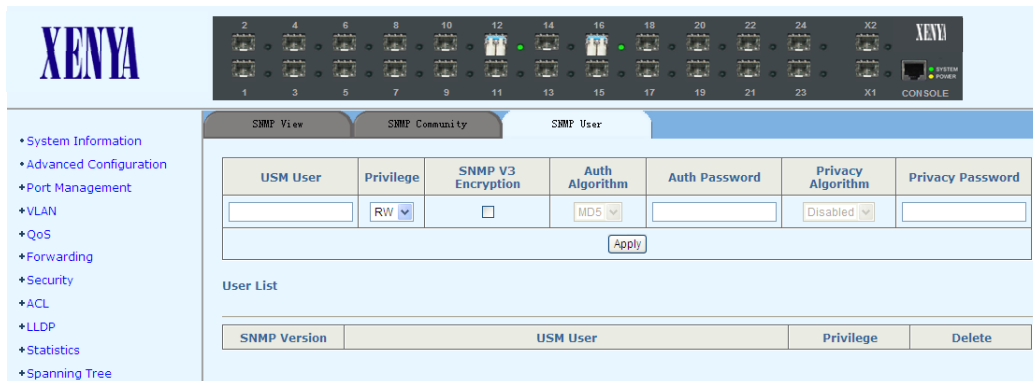

**Privacy Algorithm:** specifies the security mode as encrypted.

**DES:** specifies the encryption protocol as Data Encryption Standard (DES).

**AES:** specifies the encryption protocol as Advanced Encryption Standard (AES), which is more secure than DES.

**Privacy Password:** encryption password, a string of 9 to 15 characters in plain text, a 32-bit hexadecimal number in cipher text if MD5 algorithm is used, and a 40-bit hexadecimal number in cipher text if SHA algorithm is used.

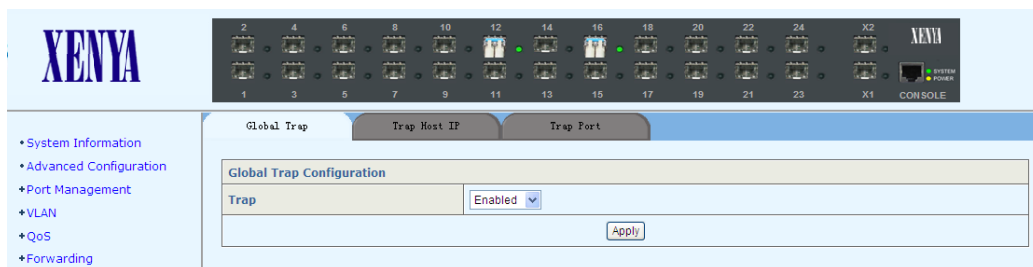

The bottom part of this page lists all existing SNMP v3 USM Users, including **SNMP Version, USM User, and Privilege**; you can delete any USM User.

### 2.13.2 SNMP Trap

There are three tag pages.

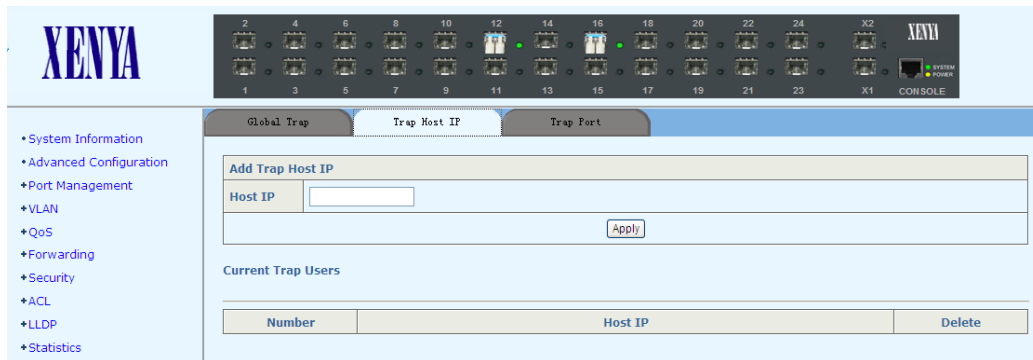

**Global Trap:** globally disables or enables the trap function; by default, the trap function is enabled.

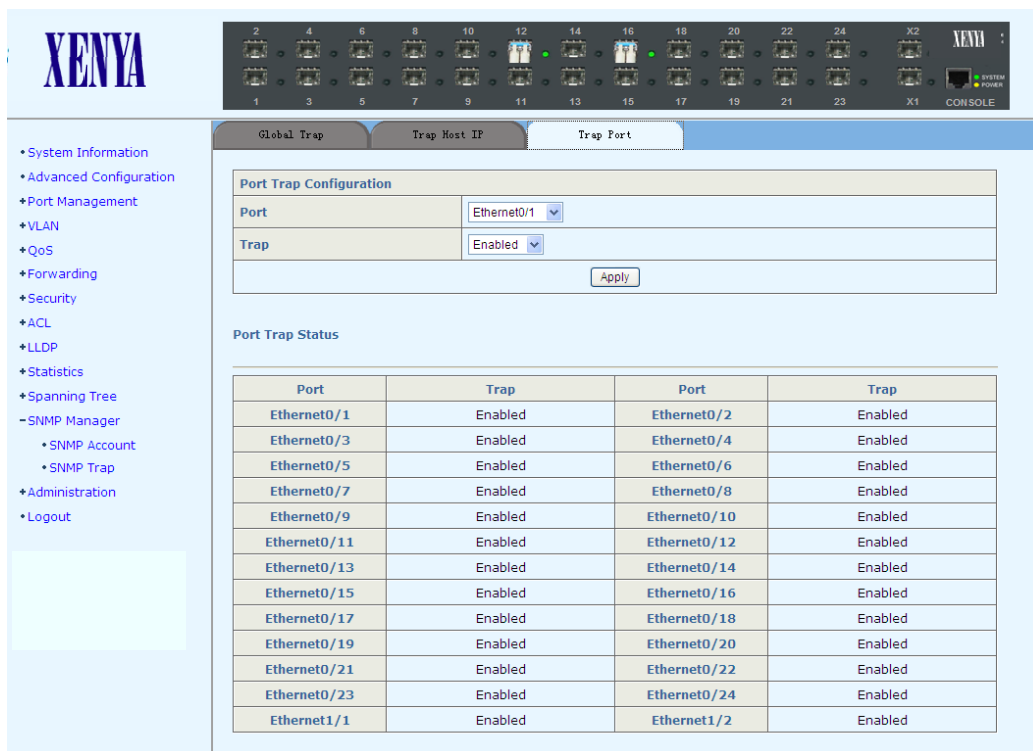

**Trap Host IP:** specifies SNMP trap Host IP. Host IP is the IPv4 address of the host to receive the traps.

The bottom part of this page lists all existing hosts' IP addresses. You can delete any trap

host IP address.

*Trap Port*: disables or enables the trap function for each port. The bottom part of this page lists the trap status of all ports.

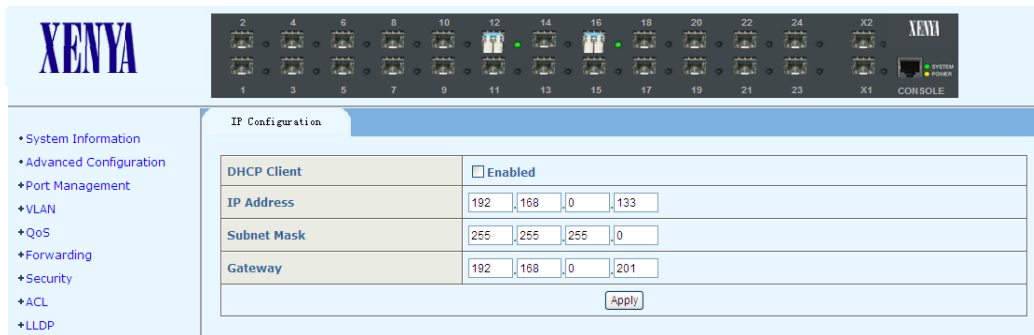

## 2.14 Administration

This part covers switch management and maintenance functions.

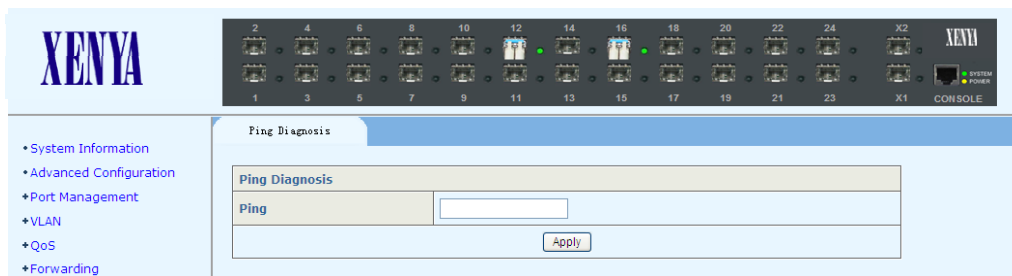

### 2.14.1 IP Configuration

The managed switch supports DHCP and Static IP. **DHCP Client** can be enabled by checking the **Enabled** checkbox. If static IP is used, **IP Address**, **Subnet Mask**, and **Gateway** shall be specified.

## 2.14.2 Ping Diagnosis

This page can be used to ping a specific IP address.

## 2.14.3 Account

This page can be used to add a new account. **Username**, **Password**, and **Privilege** for the new account are set on this page.

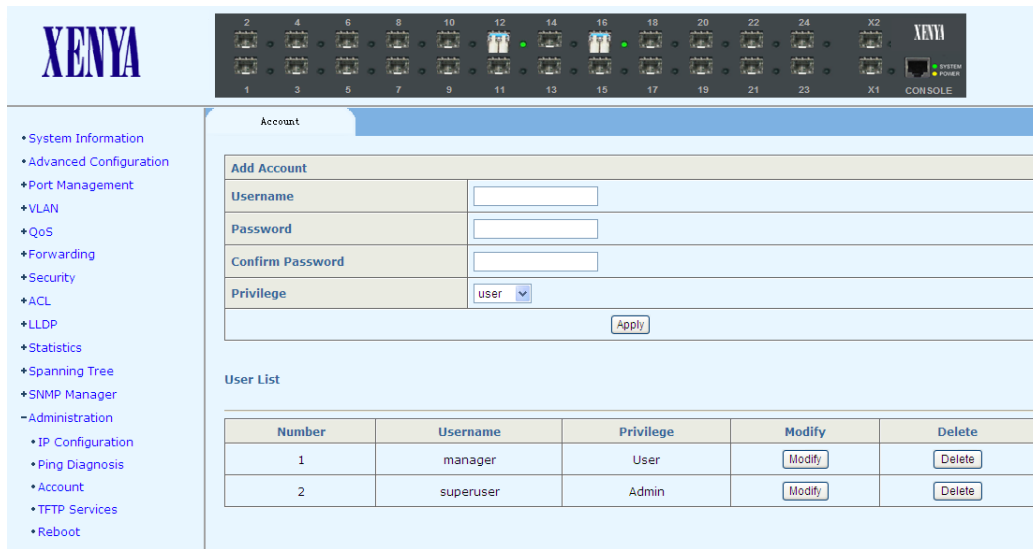

**Username:** username, a string of 3 to 16 characters.

**Password:** password, a string of 1 to 16 characters.

**Privilege:** choose **user** or **admin**.

The bottom part of this page lists all accounts, including **Username** and **Privilege**. An account can be deleted on this page.

Note: check section 3.6 "User Level" of this manual for privilege details of each level of users.

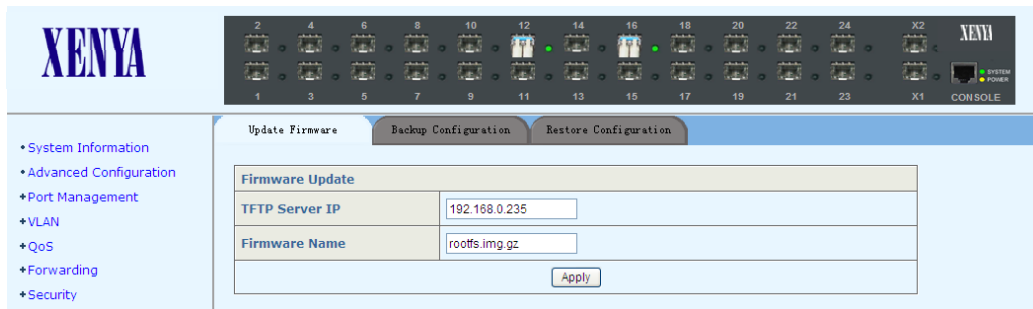

## 2.14.4 TFTP Services

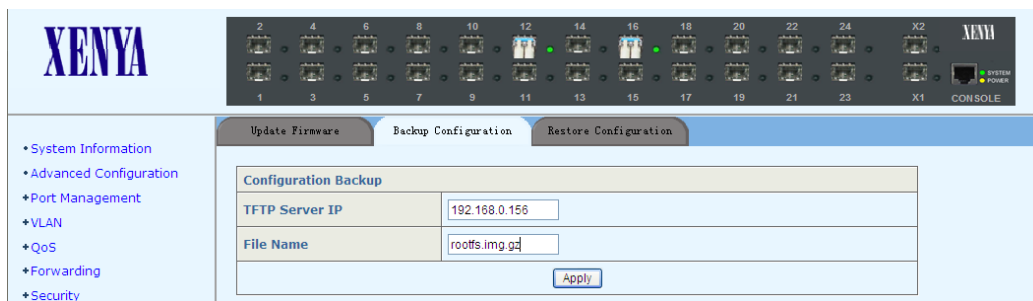

There are three tag pages.

**Update Firmware:** This page sets a **TFTP Server IP** and **Firmware Name**. Before doing firmware upgrade, make sure the switch is connected to the TFTP server and new firmware file exists on the server. The switch will begin to update firmware after **Apply** button is clicked.

**Note: please don't cut off the power supply when updating!**

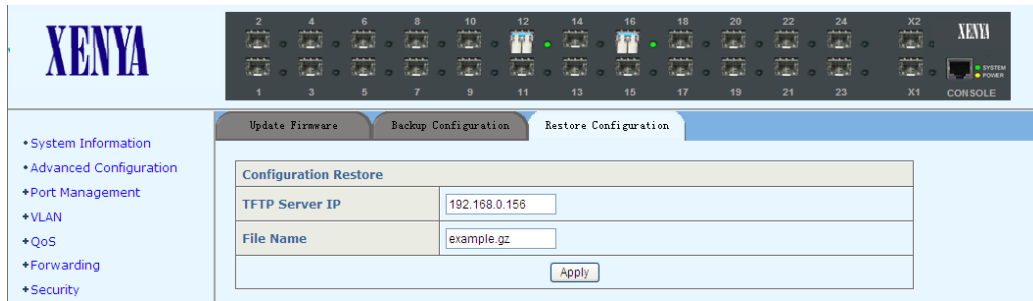

**Backup Configuration:** This page sets a **TFTP Server IP** and **File Name**. Before backing up configuration, make sure the switch is connected to the TFTP server. The switch configuration file will be uploaded to TFTP server with the specified **File Name** after **Apply** button is clicked.

**Restore Configuration:** This page sets a **TFTP Server IP** and **File Name**. Before restoring a configuration, make sure the switch is connected to the TFTP server. The switch will download the file with the specified **File Name** and use it as the configuration file after **Apply** button is clicked.

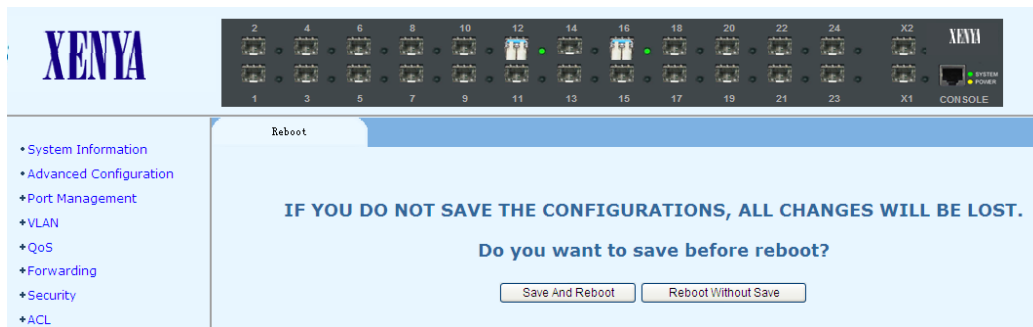

**Note:** During updating firmware, uploading or downloading a configuration file, make sure the power is not turned off.

## 2.14.5 Reboot

In this page, there are two buttons: **Save And Reboot**, and **Reboot Without Save**.

**Save And Reboot:** saves the current configuration and then reboot.

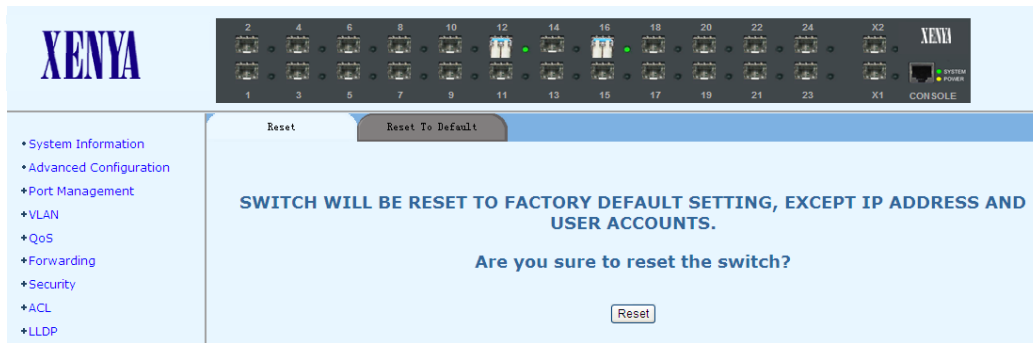

**Reboot Without Save:** directly reboots without saving the current configuration. All changes may be lost.

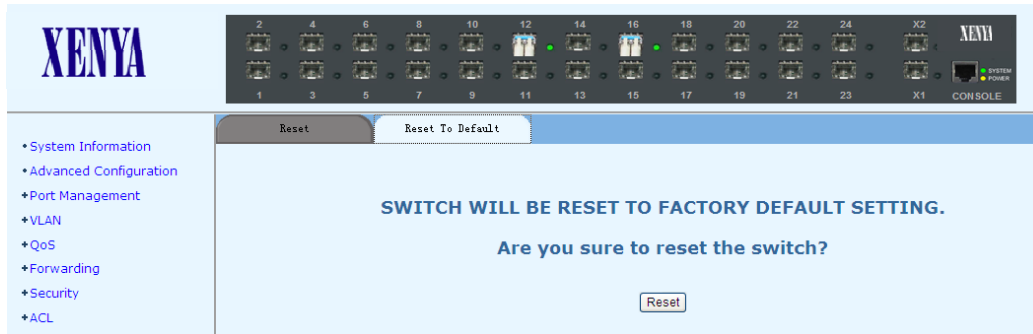

## 2.14.6 Reset

There are two tag pages: **Reset** and **Reset To Default**.

**Reset:** the switch will be reset to the factory default setting, except that the IP address and user accounts are kept unchanged.

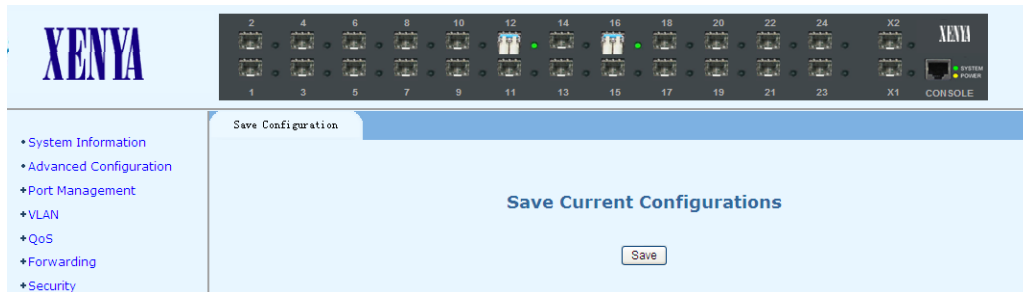

**Reset To Default:** the switch will be reset to the factory default setting.

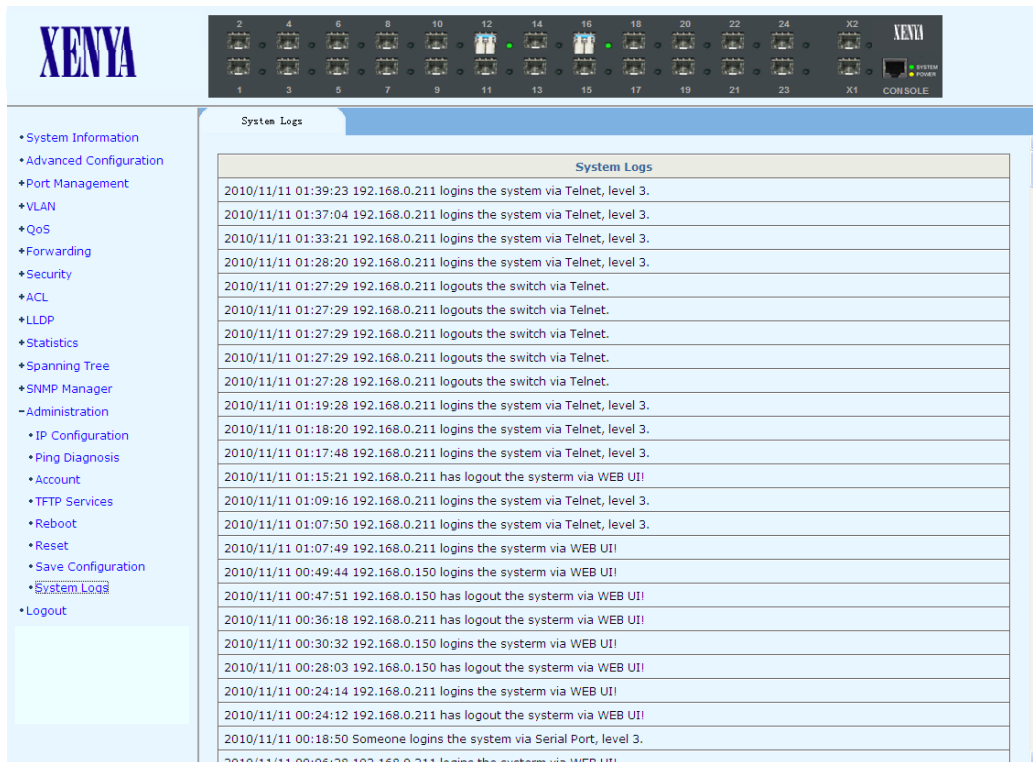

## 2.14.7 Save Configuration

This page saves current configurations.

## 2.14.8 System Logs

This page shows all of the system logs, clicking "Clear" button to clear all the records of the system logs.

## 2.15 Logout

Click "Logout" in the left menu to log out from the switch and close the browser.

## 3. Command Line Interface (CLI)

### 3.1 ERROR Message

If an incorrect parameter is entered, or the command cannot be executed, one of the following error messages will be displayed on screen.

- Incomplete command
- Wrong type parameter
- Wrong parameter value
- Ambiguous command
- Too many parameters or wrong parameter
- Invalid parameter
- Missing parameter
- Bad command

### 3.2 CLI Conventions

| Convention      | Description   |
|-----------------|---|
| <b>Boldface</b> | The keywords of a command line are in <b>Boldface</b> .   |
| <i>Italic</i>   | Command arguments are in <i>italic</i> .  |
| [ ]             | Items (keywords or arguments) in square brackets [ ] are optional.  |
| { x   y   ... } | Alternative items are grouped in braces and separated by vertical bars. Only one item is selected.                      |
| [ x   y   ... ] | Optional alternative items are grouped in square brackets and separated by vertical bars. One item or none is selected. |
| #               | A line starting with the # sign is comments.  |

### 3.3 Shortcuts Introduction

Line shortcuts list:

| Shortcuts                                     | Explanation   |
|---|---|
| <b>[Delete]</b>                               | Deletes the character on the cursor, for telnet only.               |
| <b>[ ← Backspace ]</b> or <b>[Ctrl] + [h]</b> | Deletes the left character from the cursor.                         |
| <b>[↑]</b> or <b>[Ctrl] + [p]</b>             | Execute the last command if the history list has it.                |
| <b>[↓]</b> or <b>[Ctrl] + [n]</b>             | Execute the next command if the history list has it.                |
| <b>[←]</b> or <b>[Ctrl] + [b]</b>             | Move the cursor one position left.                                  |
| <b>[→]</b> or <b>[Ctrl] + [f]</b>             | Move the cursor one position right.                                 |
| <b>[Tab]</b>                                  | Autocompletion  |
| <b>[Ctrl] + [z]</b>                           | Exit current view except in System view.                            |
| <b>[Ctrl] + [w]</b>                           | Delete characters on the left of the cursor until it meets a space. |
| <b>[Ctrl] + [a]</b>                           | Move the cursor to the beginning of the line.                       |
| <b>[Ctrl] + [e]</b>                           | Move the cursor to the end of the line.                             |
| <b>[Ctrl] + [u]</b>                           | Delete everything from the beginning of the line to the cursor.     |
| <b>[Ctrl] + [d]</b>                           | Delete one character on the cursor.                                 |
| <b>[Ctrl] + [k]</b>                           | Delete everything from the cursor to the end of the line.           |

|                     |  |
|---------------------|--|
| <b>【Ctrl】 + 【c】</b> | Skip the current command and go to a new line. |
|---------------------|--|

Page shortcuts list:

| Shortcuts                                    | Explanation           |
|--|-----------------------|
| Any key except <b>【Enter】</b> and <b>【q】</b> | Shows the next page.  |
| <b>【q】</b>                                   | Stops the displaying. |
| <b>【Enter】</b>                               | Shows the next line.  |

## 3.4 CLI Command Modes

These are the view modes for the switch:

- User view
- System view
- Ethernet port view
- Port-based VLAN view
- VLAN view
- dot1x view
- mst-region

The “Any view” in the below table refers to any one of the following: System view, Ethernet port view, Port-based VLAN view, VLAN view, or dot1x view.

| Command Mode         | Access Method  | Prompt   | Exit Method  |
|----------------------|--|--|--|
| User view            | From System view, enter the <b>disable</b> command.  | XS>  | To back to System view, enter the <b>enable</b> command.                     |
| System view          | This is the top level of access.   | XS#  | To enter into User view, enter the <b>disable</b> command.                   |
| Ethernet port view   | From System view, specify an interface by entering the <b>interface ethernet</b> command followed by interface identification. | XS(Ethernetx/x)#   | To exit to System view, enter the <b>end</b> command, or press <b>Ctrl-Z</b> |
| Port-based VLAN view | From System view, specify a vlan id by entering the <b>port-based-vlan</b> command followed by a vlan id.                      | XS(port-based-vlan-x)#                                   | To exit to System view, enter the <b>end</b> command, or press <b>Ctrl-Z</b> |
| VLAN view            | From System view, specify a vlan id by entering the <b>vlan</b> command followed by a vlan id.                                 | XS(vlanx)#   | To exit to System view, enter the <b>end</b> command, or press <b>Ctrl-Z</b> |
| dot1x view           | From System view, enter the <b>dot1x</b> command.  | XS(dot1x)#   | To exit to System view, enter the <b>end</b> command, or press <b>Ctrl-Z</b> |
| ACL view             | From System view, enter the <b>acl number</b> command, there are three prompts.  | XS(ACL-basic-x)#<br>XS(ACL-advanced-x)#<br>XS(ACL-L2-x)# | To exit to System view, enter the <b>end</b> command, or press <b>Ctrl-Z</b> |

|                 |  |                 |  |
|-----------------|--|-----------------|--|
| Mst-region view | From system view, enter the <b>spanning-tree mst-region</b> view command | XS(mst-region)# | To exit to System view, enter the <b>end</b> command, or press <b>Ctrl-Z</b> |
| Ip-binding view | From system view, enter the <b>ip-binding</b> view command               | XS(ip-binding)# | To exit to System view, enter the <b>end</b> command, or press <b>Ctrl-Z</b> |

### 3.5 Global Commands

The "Any view" in the below table refers to any one of the following: System view, Ethernet port view, Port-based VLAN view, VLAN view, or dot1x view.

**Command list:**

| View     | Command       | Explanation                                      |
|----------|---------------|--|
| Any view | <b>help</b>   | shows all available commands on current view.    |
|          | <b>clear</b>  | <b>clears screen display.</b>                    |
|          | <b>save</b>   | <b>saves current configuration.</b>              |
|          | <b>reboot</b> | reboots the switch.                              |
|          | <b>exit</b>   | <b>Logs out and disconnects from the switch.</b> |

### 3.6 User Level

There are three user levels: Visitor, User, and Admin. The default users are listed in the following table:

| Username  | Password | User level |
|-----------|----------|------------|
| guest     |          | Visitor    |
| manager   | 123      | User       |
| superuser | 123      | Admin      |

The three levels of users have different access privileges as shown on the following table:

| User level | Explanation  |
|------------|--|
| Visitor    | CAN access the following commands:<br>clear<br>disable<br>enable<br>exit<br>help<br>ping ----<br>show (note)<br><br>note: CAN NOT access the following commands:<br>show user<br>show snmp community<br>show snmp traps-host<br>show snmp user |
| User       | CAN NOT access the following commands:   |

|       |   |
|-------|---|
|       | <b>user</b><br><b>no user</b> <i>user-name</i><br><b>reset configuration</b><br><b>tftp</b> <i>server-ip</i> { <b>get</b> <i>source-file</i>   <b>put</b> <i>dest-file</i> }<br><b>update firmware</b> <i>file-name</i> <b>tftp-server</b> <i>server-ip</i> |
| Admin | CAN access all commands   |

## 3.7 System Management Commands

The "Any view" in the below table refers to any one of the following: System view, Ethernet port view, Port-based VLAN view, VLAN view, or dot1x view.

### Command list:

| View        | Command  |
|-------------|--|
| Any view    | <a href="#">show ipconfig</a>  |
| Any view    | <a href="#">show user</a>  |
| Any view    | <a href="#">show history</a>   |
| Any view    | <a href="#">show system-information</a>  |
| Any view    | <a href="#">show management</a>  |
| Any view    | <a href="#">show temperature</a>   |
| Any view    | <a href="#">show fan-status</a>  |
| Any view    | <a href="#">show power-status</a>  |
| Any view    | <a href="#">show local-time</a>  |
| System view | <a href="#">local-time date</a> <i>date</i> <a href="#">month</a> <i>month</i> <a href="#">year</a> <i>year</i><br><a href="#">local-time hour</a> <i>hour</i> <a href="#">minute</a> <i>minute</i> <a href="#">second</a> <i>second</i> |
| Any view    | <a href="#">show running-config</a>  |
| System view | <a href="#">disable</a>  |
| System view | <a href="#">enable</a>   |
| System view | <a href="#">management mode</a> { <a href="#">disable</a>   <a href="#">port-based ethernet interface</a>   <a href="#">vlan</a> <i>vlan-id</i> }  |
| System view | <a href="#">ipconfig</a> { <a href="#">auto</a>   <a href="#">ip</a> <i>ip-address</i> [ <a href="#">netmask</a> <i>netmask</i> ] [ <a href="#">gateway</a> <i>gateway</i> ] }<br><a href="#">no ipconfig</a>                            |
| System view | <a href="#">ping</a> <i>ip-address</i>   |
| System view | <a href="#">user</a><br><a href="#">no user</a> <i>user-name</i>   |
| System view | <a href="#">reset configuration</a>  |
| System view | <a href="#">reset counters</a> [ <a href="#">ethernet interface</a> ]  |
| System view | <a href="#">tftp</a> <i>server-ip</i> { <a href="#">get</a> <i>source-file</i>   <a href="#">put</a> <i>dest-file</i> }  |
| System view | <a href="#">update firmware</a> <i>file-name</i> <b>tftp-server</b> <i>server-ip</i>   |
| System view | <a href="#">xs-view</a><br><a href="#">no xs-view</a>  |

### show ipconfig

#### Syntax

```
show ipconfig
```

#### View

Any view.

#### Parameters

None.

#### Description

Use **show ipconfig** command to display the IP address of the switch, including IP address, IP netmask, and IP gateway.

#### Examples

```
XS# show ipconfig
Operation Mode: Manual Setting
IP address: 192.168.0.253
IP netmask: 255.255.255.0
IP gateway: 192.168.0.201
```

## show user

#### Syntax

**show user**

#### View

Any view.

#### Parameters

None.

#### Description

Use **show user** command to list all user information, including user name, user password, and user level.

#### Examples

```
XS# show user

  user          password          level
  -----          -
  guest          xxx               Visitor
  manager        xxx               User
  superuser      xxx               Admin
```

## show history

#### Syntax

**show history**

#### View

Any view.

### Parameters

None.

### Description

Use **show history** command to list history commands of the current user. History commands are those commands that were successfully executed previously and saved in the history command buffer. When the history command buffer is full, the earlier commands will be overwritten by the new ones. By default, the CLI can save 30 history commands for each user.

### Examples

```
XS# show history
246 show snmp community
247 show snmp traps-host
248 show snmp traps-status
249 show snmp user
250 interface ethernet 0/23
251 snmp-traps
252 no snmp-traps
253 show snmp
254 end
255 show snmp community
256 show snmp user
257 show snmp user
258 show snmp traps-host
259 show snmp traps-status
260 show snmp
261 snmp-server name guohq-XS7424
262 show snmp
263 snmp-server name dev-XS7424
264 show snmp
265 snmp-server community
266 snmp-server user
267 snmp-server user
268 snmp-server user
269 snmp-server traps
270 ping 64.233.189.104
271 snmp-server traps-host
272 snmp-server traps-host 192.168.0.111
273 show log
274 no log
275 show history
```

## **show system-information**

### Syntax

**show system-information**

### View

Any view.

### Parameters

None.

## Description

Use **show system-information** command to display the basic information of the switch, including system name, system description, system location, system contact, hardware version, firmware version, boot loader version, MAC address, and System ID.

## Examples

XS# **show system-information**

```
System Name       : XS26GS
System Description : Optical Ethernet Switch
System Location   : Ljubljana, Slovenia
System Contact    : support@xenia.si
Hardware Version  : 1.0SFP
Firmware Version  : 1.071
Boot Loader Version : 1.0.1
MAC Address       : 28-b0-cc-12-34-51
System ID         : R3A1234561
```

## show management

### Syntax

**show management**

### View

Any view.

### Parameters

None.

### Description

Use **show management** command to display the management mode. It can be disabled, port-based, vlan and other related information.

## Examples

```
XS# show management
Management mode is port-based.
Management port is Ethernet0/2
```

## show temperature

### Syntax

**Show temperature**

### View

Any view

### Parameters

None

#### Description

Use **show temperature** command to display the current environmental temperature of switch.

#### Example

```
XS# show temperature
Current temperature: 46.5 degree Celsius
```

## show fan-status

#### Syntax

**Show fan-status**

#### View

Any view

#### Parameters

None

#### Description

Use **show fan-status** command to display the current status of the fans in the switch.

#### Example

```
XS# show fan-status
Fan status: Warning
```

## show power-status

#### Syntax

**show power-status**

#### View

Any view

#### Parameters

None

#### Description

Use **show power-status** command to display the current status of power supply. There are two power supplies in the switch.

#### Example

```
XS# show power-status
```

Power A status : Off  
Power B status : Off

## show local-time

### Syntax

**Show local-time**

### View

Any view

### Parameters

None

### Description

Use **show local-time** command to display the current and local time.

### Example

```
XS# show local-time
Local Time:
Tue Oct 13 10:19:30 2009
```

## local-time

### Syntax

**local-time date** *date* **month** *month* **year** *year*  
**local-time hour** *hour* **minute** *minute* **second** *second*

### View

System view

### Parameters

*date*: Required, between 1 to 31.  
*month*: Required, between 1 to 12.  
*year*: Required, between 2009 to 3000  
*hour*: Required, between 0 to 23.  
*minute*: Required, between 0 to 59.  
*second*: Required, between 0 to 59.

### Description

Use **local-time date** *date* **month** *month* **year** *year* command to set the date.  
Use **local-time hour** *hour* **minute** *minute* **second** *second* command to set the time.

### Example

```
XS# local-time hour 14 minute 23 second 21
Set successfully!
```

## show running-config

### Syntax

**show running-config**

### View

Any view

### Parameters

None

### Description

Use **show running-config** command to display which configuration you have set.

### Example

```
XS# show running-config

Current Running Configuration:

    ACL configuration
    Valid ACL Num: 2, 23, 48,

    VLAN configuration
    VLAN Mode   : 802.1Q VLAN
    802.1Q Tag VLAN Ingress Filtering: Disable
    Vlan 1(VID)
    Vlan Name: Default
    Untag Members:
    Ethernet0/1
    Ethernet0/2
    Ethernet0/3
    Ethernet0/4
    Ethernet0/5
    Ethernet0/6
    Ethernet0/7
    Ethernet0/8
    Ethernet0/9
    Ethernet0/10
    Ethernet0/11
    Ethernet0/12
    Press any key to continue (Q to quit)
```

## disable

### Syntax

**disable**

### View

System view.

### Parameters

None.

#### Description

Use **disable** command to log out from the current user.

#### Examples

```
XS# disable  
Exit current level successfully!  
XS>
```

## enable

#### Syntax

**enable**

#### View

System view.

#### Parameters

None.

#### Description

Use **enable** command to log in as another user.

#### Examples

```
XS> enable  
user : superuser  
password: ***  
  
Entry level 3 (admin) successfully!
```

## management mode

#### Syntax

**management mode { disable | port-based ethernet *interface* | vlan *vlan-id* }**

#### View

System view.

#### Parameters

**port-based ethernet *interface***: uses the port based management mode and sets a management interface.

**Vlan *vlan-id***: uses vlan management mode and sets a management vlan.

#### Description

Use the management mode command to set the management mode and related parameters.

### Examples

```
XS# management mode vlan 2  
Management mode is vlan.  
Management vlan is 2
```

## ipconfig

### Syntax

```
ipconfig { auto | ip ip-address [ netmask netmask ] [ gateway gateway ] }  
no ipconfig
```

### View

System view.

### Parameters

**auto**: configures IP address automatically (DHCP-client)  
**ip**: configures IP address manually

### Description

Use **ipconfig auto** command to configure IP address automatically.  
Use **ipconfig ip** command to configure IP address manually.  
Use **no ipconfig** to restore the default IP configuration.  
The default IP configuration is in the static mode, the IP address is 192.168.0.253, the netmask is 255.255.255.0, and the gateway is 192.168.0.201.

### Examples

```
XS# ipconfig auto  
Do you want to configure IP automatically (DHCP-client) ? (y/n):y  
XS# show ipconfig  
Operation Mode: Auto (DHCP-Client)  
IP address: 192.168.0.11  
IP netmask: 255.255.255.0  
IP gateway: 192.168.0.201
```

## ping

### Syntax

```
ping ip-address
```

### View

System view.

### Parameters

*ip-address*: specifies the destination IP address to send ICMP ECHO-REQUEST packet.

### Description

Use **ping** command to check the reachability of a host.  
The executing procedure of **ping** command is: First, the source host sends an ICMP

ECHO-REQUEST packet to the destination host. Then, if the connection to the destination network is normal, the destination host receives this packet and responds with an ICMP ECHO-REPLY packet.

You can use **ping** command to check the network connectivity.

### Examples

```
XS# ping 192.168.0.234
This IP is alive!
```

## user

### Syntax

```
user
no user user-name
```

### View

System view.

### Parameters

*user-name*: specifies the user name to be deleted.

### Description

Use **user** command to add a user. To add the user, you should specify user name, user password, and user level.

Use **no user** command to delete a specified user.

### Examples

```
#add a user named test1, password is test1, user level is admin
```

```
XS# user
user name      : test1

password       : *****

password(again): *****
```

```
level(2-User, 3-Admin): 3
Add user successfully!
```

```
#delete user named test1
```

```
XS# no user test1
Deleting user successfully!
```

## reset configuration

### Syntax

```
reset configuration
```

### View

System view.

### Parameters

None.

### Description

Use **reset configuration** command to make all of the factory default settings to be restored on the switch. When asked "Do you want to reset all the configurations except IP address and user account? (y/n)", if you choose "y", the switch will be reset to factory default settings, except for the IP address and user account; if you choose "n", the switch will be reset to factory default settings including IP address and user account. The switch will reboot to take the configuration into effect.

### Examples

```
XS# reset configuration
Do you want to reset all the configurations except IP address and user account?
(y/n): n
Resetting configuration, please wait...
Resetting default configuration successfully!
```

## reset counters

### Syntax

```
reset counters [ ethernet interface ]
```

### View

System view.

### Parameters

*interface*: specifies the Ethernet port.

### Description

Use **reset counters** command to reset the statistics counters in one or all ports.

### Examples

```
XS# reset counters ethernet 0/1
Clear the statistics of port ethernet 0/1
```

## tftp

### Syntax

```
tftp server-ip { get source-file | put dest-file }
```

### View

System view.

### Parameters

*server-ip*: IP address or host name of the TFTP server connected; the IP address is in X.X.X.X format.

**get**: specified to download a file from the TFTP server.

*source-file*: name of the file to be downloaded.

**put**: specified to upload a file to the TFTP server.  
*dest-file*: file name used when a file is uploaded and saved to a TFTP server.

### Description

Use **tftp** *tftp-server* command to connect to a TFTP server and perform download or upload operations. Upload operation will backup the configuration in a file on tftp server, and download operation will restore the configuration from a file on tftp server.

### Examples

```
XS# tftp 192.168.0.234 put configtest  
Backing up the configuration, please wait...  
Backup the configuration successfully!
```

## update firmware

### Syntax

```
update firmware file-name tftp-server server-ip
```

### View

System view.

### Parameters

*server-ip*: IP address or host name of the TFTP server connected, the IP address is in X.X.X.X format.  
*file-name*: filename of firmware.

### Description

Use **update firmware** command to download new firmware from tftp server and update the new firmware to the switch.

### Examples

```
XS# update firmware rootfs.img.gz tftp-server 192.168.0.234  
Update the firmware, please wait...
```

## xs-view

### Syntax

```
xs-view  
no xs-view
```

### View

System view.

### Parameters

*xs-view*: enable/disable the XS View network management function

### Description

Use **xs-view** command to enable the XS View network management function.  
 Use **no xs-view** command to disable the XS View network management function.

### Examples

```
XS# xs-view
XS View function has been enabled successfully.
```

```
XS# no xs-view
XS View function has been disabled successfully.
```

## 3.8 Port Basic Configuration Commands

The “Any view” in the below table refers to any one of the following: System view, Ethernet port view, Port-based VLAN view, VLAN view, or dot1x view.

### Command list:

| View               | Command   |
|--------------------|---|
| Any view           | <a href="#">show interface [ ethernet interface ]</a>   |
| Any view           | <a href="#">show interface statistics [ ethernet interface ]</a>  |
| Any view           | <a href="#">show interface switchport ethernet interface</a>  |
| Any view           | <a href="#">show storm-control</a>  |
| System view        | <a href="#">interface ethernet interface</a>  |
| Ethernet port view | <a href="#">end</a>   |
| Ethernet port view | <a href="#">shutdown</a><br><a href="#">no shutdown</a>   |
| Ethernet port view | <a href="#">speed { 10   100   1000   auto }</a><br><a href="#">no speed</a>  |
| Ethernet port view | <a href="#">duplex { auto   full   half }</a><br><a href="#">no duplex</a>  |
| Ethernet port view | <a href="#">flow-control</a><br><a href="#">no flow-control</a>   |
| Ethernet port view | <a href="#">learning</a><br><a href="#">no learning</a>   |
| Ethernet port view | <a href="#">line-rate { egress   ingress } rate rate-value</a><br><a href="#">no line-rate { egress   ingress }</a> |
| Ethernet port view | <a href="#">jumboframe</a><br><a href="#">no jumboframe</a>   |
| System view        | <a href="#">storm-control type type rate rate</a><br><a href="#">no storm-control</a>                               |

### show interface

#### Syntax

```
show interface [ ethernet interface ]
```

#### View

Any view.

#### Parameters

*interface* : ethernet port, in the form of interface = { interface-type/interface-number}, interface-type = {0 | 1}, when interface-type is 0, interface-number = { 1 | 2 | ... | 24 }, when interface-type is 1, interface-number = { 1 | 2 }.

### Description

Use **show interface** command to display the brief configuration information of one or all interfaces, including: interface type, link state, link nego, speed, duplex attribute, flow control, ingress rate and egress rate.

### Examples

```
XS# show interface
```

```
PORT STATE/LINK/NEGO/SPEED/DUPLEX/FLOW-CONTROL/LEARN/INGRESS/EGRESS/JUMBOFRAME
-----
Ethernet0/1 enabled /down/ auto/ - / - / - / enable/disable/disable/9216
Ethernet0/2 enabled /down/ auto/ - / - / - / enable/disable/disable/9216
Ethernet0/3 enabled /down/ auto/ - / - / - / enable/disable/disable/1518
Ethernet0/4 enabled /down/ auto/ - / - / - / enable/disable/disable/9216
Ethernet0/5 enabled /down/ auto/ - / - / - / enable/disable/disable/9216
Ethernet0/6 enabled /down/ auto/ - / - / - / enable/disable/disable/9216
Ethernet0/7 enabled /down/ auto/ - / - / - / enable/disable/disable/9216
Ethernet0/8 enabled /down/ auto/ - / - / - / enable/disable/disable/9216
Ethernet0/9 enabled / up / auto/1000M/full/off/ enable/disable/disable/9216
Ethernet0/10 enabled /down/ auto/ - / - / - / enable/disable/disable/9216
Ethernet0/11 enabled /down/ auto/ - / - / - / enable/disable/disable/9216
Ethernet0/12 enabled /down/ auto/ - / - / - / enable/disable/disable/9216
Ethernet0/13 enabled /down/ auto/ - / - / - / enable/disable/disable/9216
Ethernet0/14 enabled /down/ auto/ - / - / - / enable/disable/disable/9216
Ethernet0/15 enabled /down/ auto/ - / - / - / enable/disable/disable/9216
Ethernet0/16 enabled /down/ auto/ - / - / - / enable/disable/disable/9216
Ethernet0/17 enabled /down/ auto/ - / - / - / enable/disable/disable/9216
Ethernet0/18 enabled /down/ auto/ - / - / - / enable/disable/disable/9216
Ethernet0/19 enabled /down/ auto/ - / - / - / enable/disable/disable/9216
Ethernet0/20 enabled /down/ auto/ - / - / - / enable/disable/disable/9216
Ethernet0/21 enabled /down/ auto/ - / - / - / enable/disable/disable/9216
Ethernet0/22 enabled /down/ auto/ - / - / - / enable/disable/disable/9216
Ethernet0/23 enabled /down/ auto/ - / - / - / enable/disable/disable/9216
Ethernet0/24 enabled / up / auto/1000M/full/off/ enable/disable/disable/9216
Ethernet1/1 enabled /down/ auto/ - / - / - / enable/disable/disable/9216
Ethernet1/2 enabled /down/ auto/ - / - / - / enable/disable/disable/9216
```

```
XS# show interface ethernet 0/1
```

```
PORT STATE/LINK/NEGO/SPEED/DUPLEX/FLOW-CONTROL/LEARN/INGRESS/EGRESS/JUMBOFRAME
-----
Ethernet0/1 enabled/down/ auto/ - / - / - /enable /disable/disable/9216
```

## show interface statistics

### Syntax

```
show interface statistics [ ethernet interface ]
```

### View

Any view.

## Parameters

*interface* : ethernet port, in the form of interface = { interface-type/interface-number}, interface-type = {0 | 1}, when interface-type is 0, interface-number = { 1 | 2 | ... | 24 }, when interface-type is 1, interface-number = { 1 | 2}.

## Description

Use **show interface statistics** command to display the statistics information of one or all interfaces, including: transmitted good packets, transmitted bad packets, received good packets, transmitted abort packets, collision packets, dropped packets.

## Examples

```
XS# show interface statistics ethernet 0/11
PORT          TXGOODPKTS      TXBADPKTS  RXGOODPKTS  TXABORT
COLLISION DROPPKT
              H32bits  L32bits      H32bits    L32bits
Ethernet0/11 0          79         0          0         5389      0    0    0
```

## show interface switchport

### Syntax

**show interface switchport ethernet** *interface*

### View

Any view.

### Parameters

*interface* : ethernet port, in the form of interface = { interface-type/interface-number}, interface-type = {0 | 1}, when interface-type is 0, interface-number = { 1 | 2 | ... | 24 }, when interface-type is 1, interface-number = { 1 | 2}.

### Description

Use **show interface switchport** command to display the information of the interface, including: vlan vid, egress rule, port membership type, pvid, link type, and frame type.

## Examples

```
XS# show interface switchport ethernet 0/1
Vlan vid: 1
Egress rule: untagged
Port membership type: static
Pvid: 1
Link type: Hybrid
Frame type: Admit all
```

## show storm-control

### Syntax

**show storm-control**

### View

Any view.

### Parameters

None.

### Description

Use **show storm-control** command to display the storm control configurations.

### Examples

```
XS(vlan2)# show storm-control  
Show storm-control information  
Type      :Broadcast  
Rate      :1000pps
```

## interface ethernet

### Syntax

**interface ethernet** *interface*

### View

System view.

### Parameters

*interface* : ethernet port, in the form of *interface* = { *interface-type/interface-number* }, *interface-type* = { 0 | 1 }, when *interface-type* is 0, *interface-number* = { 1 | 2 | ... | 24 }, when *interface-type* is 1, *interface-number* = { 1 | 2 }.

### Description

Use **interface ethernet** command to enter a specific port view. Before configuring an Ethernet port, you need to enter an Ethernet port view.

### Examples

```
XS# interface ethernet 0/23  
XS(Ethernet0/23)#
```

## end

### Syntax

**end**

### View

Ethernet port view.

### Parameters

None.

### Description

Use **end** command to exit from the Ethernet port configuration environment.

### Examples

```
XS(Ethernet0/9)# end  
XS#
```

## shutdown

### Syntax

```
shutdown  
no shutdown
```

### View

Ethernet port view.

### Parameters

None.

### Description

Use **shutdown** command to shut down an Ethernet port.  
Use **no shutdown** command to bring up an Ethernet port.  
By default, an Ethernet port is in up state.

### Examples

```
XS(Ethernet0/24)# shutdown  
Port ethernet0/24 shut down.
```

## speed

### Syntax

```
speed { 10 | 100 | 1000 | auto }  
no speed
```

### View

Ethernet port view.

### Parameters

**10**: specifies the port speed to 10 Mbps.  
**100**: specifies the port speed to 100 Mbps.  
**1000**: specifies the port speed to 1,000 Mbps (only available on Gigabit Ethernet ports).  
**auto**: specifies the port speed to the auto-negotiation mode.

### Description

Use **speed** command to set the port speed.  
Use **no speed** command to restore the port speed to the default setting.  
By default, the port speed is in the auto-negotiation mode.  
Note that you can only specify the **1000** and **auto** keyword for Gigabit Ethernet ports.

### Examples

```
XS(Ethernet0/23)# speed 10  
speed configured at 10Mbps on ethernet0/23
```

## duplex

### Syntax

```
duplex { auto | full | half }  
no duplex
```

### View

Ethernet port view.

### Parameters

**auto**: sets the port to auto-negotiation mode.  
**full**: sets the port to full duplex mode.  
**half**: sets the port to half duplex mode.

### Description

Use **duplex** command to set the duplex mode of the port.  
Use **no duplex** command to restore the default duplex mode, that is, auto-negotiation.  
By default, the port is in auto-negotiation mode.

### Examples

```
XS(Ethernet0/23)# duplex half  
duplex configured half on ethernet0/23
```

## flow-control

### Syntax

```
flow-control  
no flow-control
```

### View

Ethernet port view.

### Parameters

None.

### Description

Use **flow-control** command to enable flow control on the Ethernet port.  
Use **no flow-control** command to disable flow control on the port.  
In the case that flow control is enabled on both the local and peer switches, when congestion occurs on the local switch, the local switch sends a message to notify the peer switch to stop sending packets to itself or reduce the sending rate temporarily. The peer switch will stop sending packets to the local switch or reduce the sending rate temporarily when it receives the message; and vice versa. In this way, packet loss is avoided to make the network operation normal.  
By default, flow control is disabled on a port.

### Examples

```
XS(Ethernet0/23)# flow-control  
flow-control is enabled on ethernet0/23.
```

## learning

### Syntax

```
learning  
no learning
```

### View

Ethernet port view.

### Parameters

None.

### Description

Use **learning** command to enable learning MAC address on the Ethernet port.  
Use **no learning** command to disable learning MAC address on the port.  
By default, learning MAC address is enabled on a port.

### Examples

```
XS(Ethernet0/1)# no learning  
Learning is disabled on ethernet0/1.
```

## line-rate

### Syntax

```
line-rate { egress | ingress } rate rate-value  
no line-rate { egress | ingress }
```

### View

Ethernet port view.

### Parameters

**rate** *rate-value*: the upper rate threshold of the port. The *rate-value* is one of 64k,128k,192k,256k,320k,484k,512k,640k,768k,896k,1m,2m,4m,8m,10m,15m,20m,30m,40m,50m,60m,70m,80m,90m

#### Description

Use **line-rate** command to configure the upper threshold of the traffic rate in Ethernet port view.

Use **no line-rate** command to cancel the upper threshold of the traffic rate in Ethernet port view.

#### Examples

```
XS(Ethernet0/1)# line-rate egress rate 64k  
Egress rate is 64kbps on ethernet0/1
```

```
XS(Ethernet0/1)# no line-rate egress  
Turn off egress rate-limit on port ethernet0/1.
```

## jumboframe

#### Syntax

```
jumboframe  
no jumboframe
```

#### View

Ethernet port view.

#### Parameters

#### Description

Use **jumboframe** command to set the max length of frame as 9216.

Use **no jumboframe** command to restore the max length of frame to the default value 1518.

#### Examples

```
XS(Ethernet0/1)# jumboframe  
Max frame length is 9216 on ethernet0/1.
```

```
XS(Ethernet0/3)# no jumboframe  
Max frame length is 1518 on ethernet0/3.
```

## storm-control

#### Syntax

```
storm-control type type rate rate  
no storm-control
```

#### View

System view.

**Parameters**

**type** *type*: type is in the range from 1 to 7.  
 1:Broadcast  
 2:Multicast  
 3:Destination Lookup Failed(DLF)  
 4:Broadcast+Multicast  
 5:Broadcast+DLF  
 6:Multicast+DLF  
 7:Broadcast+Multicast+DLF  
**rate** *rate*: rate is in the range from 1 to 262143.

**Description**

Use **storm-control** command to set the upper threshold of the broadcast/multicast/DLF (Destination Lookup Failed) traffic received on the port. Use **no storm-control** command to remove the threshold configuration. With the traffic upper threshold specified on a port, the system periodically collects statistics of the broadcast/multicast/DLF traffic on the port. Once a type of traffic exceeds the specified upper threshold, it blocks this type of traffic on the port.

**Examples**

XS# **storm-control type 2 rate 2000**  
 Configuration completed successfully.

### 3.9 Link Aggregation Commands

The "Any view" in the below table refers to any one of the following: System view, Ethernet port view, Port-based VLAN view, VLAN view, or dot1x view.

**Command list:**

| View               | Command   |
|--------------------|---|
| Any view           | <a href="#"><b>show lacp system-id</b></a>  |
| Any view           | <a href="#"><b>show lacp mode</b></a>   |
| Any view           | <a href="#"><b>show link-aggregation interface ethernet <i>interface</i> [ to ethernet <i>interface</i> ]</b></a>   |
| Any view           | <a href="#"><b>show link-aggregation summary</b></a>  |
| Any view           | <a href="#"><b>show link-aggregation verbose <i>agg-id</i></b></a>  |
| System view        | <a href="#"><b>lacp</b></a>   |
| Ethernet port view | <a href="#"><b>no lacp</b></a>  |
| System view        | <a href="#"><b>lacp system-priority <i>system-priority</i></b></a><br><a href="#"><b>no lacp system-priority</b></a>  |
| System view        | <a href="#"><b>link-aggregation group <i>agg-id</i> description <i>agg-name</i></b></a><br><a href="#"><b>no link-aggregation group <i>agg-id</i> description</b></a> |
| System view        | <a href="#"><b>link-aggregation group <i>agg-id</i> mode { manual   static }</b></a><br><a href="#"><b>no link-aggregation group <i>agg-id</i></b></a>                |
| Ethernet port view | <a href="#"><b>lacp port-priority <i>port-priority</i></b></a><br><a href="#"><b>no lacp port-priority</b></a>  |
| Ethernet port view | <a href="#"><b>link-aggregation group <i>agg-id</i></b></a><br><a href="#"><b>no link-aggregation group</b></a>   |

**show lacp system-id**

Syntax

**show lacp system-id**

View

Any view.

Parameters

None.

Description

Use **show lacp system-id** command to display the device ID of the local system, including system priority and MAC address.

Examples

```
XS(Ethernet0/8)# show lacp system-id

LACP System ID: 1:00-0a-0b-0c-0e-09
```

## show lacp mode

Syntax

**show lacp mode**

View

Any view.

Parameters

None.

Description

Use **show lacp mode** command to list the lacp mode on each port.

Examples

```
XS(Ethernet0/1)# show lacp mode
```

| PORT         | ACTIVE-STATE |
|--------------|--------------|
| -----        | -----        |
| Ethernet0/1  | active       |
| Ethernet0/2  | -            |
| Ethernet0/3  | -            |
| Ethernet0/4  | -            |
| Ethernet0/5  | -            |
| Ethernet0/6  | -            |
| Ethernet0/7  | -            |
| Ethernet0/8  | -            |
| Ethernet0/9  | -            |
| Ethernet0/10 | -            |
| Ethernet0/11 | -            |

|              |   |
|--------------|---|
| Ethernet0/12 | - |
| Ethernet0/13 | - |
| Ethernet0/14 | - |
| Ethernet0/15 | - |
| Ethernet0/16 | - |
| Ethernet0/17 | - |
| Ethernet0/18 | - |
| Ethernet0/19 | - |
| Ethernet0/20 | - |
| Ethernet0/21 | - |
| Ethernet0/22 | - |
| Ethernet0/23 | - |
| Ethernet0/24 | - |
| Ethernet1/1  | - |
| Ethernet1/2  | - |
| Ethernet1/3  | - |
| Ethernet1/4  | - |

## show link-aggregation interface

### Syntax

**show link-aggregation interface ethernet** *interface 1* [ **to ethernet** *interface 2* ]

### View

Any view.

### Parameters

*Interface 1*: port number.

*Interface 2*: in conjunction with *interface 1*, defines a range of port numbers whose link aggregation details are to be displayed. The value of *interface 2* must not be less than that of *interface 1*..

### Description

Use **show link-aggregation interface** command to display the link aggregation details of a specified port or a range of ports.

### Examples

XS# **show link-aggregation interface ethernet 0/7**

```
link-aggregation ID    : 5
Actor:
  Port Priority        : 1
  System ID           : 0-a-b-c-e-9
  Oper key             : 5
```

## show link-aggregation summary

### Syntax

**show link-aggregation summary**

### View

Any view.

**Parameters**

None.

**Description**

Use **show link-aggregation summary** command to display summary information of all aggregation groups.

**Examples**

```
XS# show link-aggregation summary
1:00-0a-0b-0c-0e-09
LA      LA      Partner          Selected
ID      Type     ID               Ports
-----
1       Manual   Partner         Ethernet0/1,3
2       Manual   Partner         Ethernet0/6,8
5       Static   Partner         Ethernet0/5,7
```

**show link-aggregation verbose**

**Syntax**

```
show link-aggregation verbose agg-id
```

**View**

Any view.

**Parameters**

*agg-id*: aggregation group ID, which is in a range from 1 to 13 and must be the ID of an existing aggregation group.

**Description**

Use **show link-aggregation verbose** command to display the details of a specified aggregation group or all aggregation groups.

**Examples**

```
XS# show link-aggregation verbose 5
Link-aggregation ID: 5
Link-aggregation Type: Static
Link-aggregation Description: test5
System ID:      1, 0-a-b-c-e-9
Local:
Port No      Status          Priority      key
-----
Ethernet0/5  Selected       1            5
Ethernet0/7  Selected       1            5
```

**lACP**

**Syntax**

**lacp**  
**no lacp**

#### View

System view, Ethernet port view.

#### Parameters

None.

#### Description

Use **lacp** command to enable LACP globally in system view or enable LACP on the port in ethernet port view.

Use **no lacp** command to disable LACP globally in system view or disable LACP on the port in ethernet port view.

By default, LACP is disabled on a port.

#### Examples

```
#enable LACP globally
XS# lacp
LACP is enabled now!
```

```
#enable LACP on ethernet port 0/2
XS(Ethernet0/2)# lacp
The port is enabled!
```

## lacp system-priority

#### Syntax

```
lacp system-priority system-priority  
no lacp system-priority
```

#### View

System view.

#### Parameters

*system-priority*: System priority, ranging from 1 to 65,535.

#### Description

Use **lacp system-priority** command to set the system priority.

Use **no lacp system-priority** command to restore the default system priority.

By default, the system priority is 1.

#### Examples

```
XS# lacp system-priority 20
System priority is 20 now.
```

## link-aggregation group description

#### Syntax

**link-aggregation group** *agg-id* **description** *agg-name*  
**no link-aggregation group** *agg-id* **description**

#### View

System view.

#### Parameters

*agg-id*: aggregation group ID, in a range from 1 to 13.  
*agg-name*: aggregation group name, a string of 1 to 32 characters.

#### Description

Use **link-aggregation group description** command to set a description for an aggregation group.  
Use **no link-aggregation group description** command to remove the description of an aggregation group.

#### Examples

```
XS# link-aggregation group 3 description test3  
The configuration is successful.
```

## link-aggregation group mode

#### Syntax

**link-aggregation group** *agg-id* **mode** {**manual** | **static**}  
**no link-aggregation group** *agg-id*

#### View

System view.

#### Parameters

*agg-id*: aggregation group ID, in a range from 1 to 13.  
**manual**: creates a manual aggregation group.  
**static**: creates a static aggregation group.

#### Description

Use **link-aggregation group mode** command to create a manual or static aggregation group.  
Use **no link-aggregation group** command to remove the specified aggregation group.

#### Examples

```
XS# link-aggregation group 3 mode static  
The link-aggregation group is in the Static Mode now.  
The configuration is successful.
```

## lacp port-priority

#### Syntax

**lacp port-priority** *port-priority*  
**no lacp port-priority**

#### View

Ethernet port view.

#### Parameters

*port-priority*: port priority, ranging from 1 to 65,535.

#### Description

Use **lacp port-priority** command to set priority of the port.  
Use **undo lacp port-priority** command to restore the default port priority.  
By default, the port priority is 1.

#### Examples

```
XS(Ethernet0/2)# lacp port-priority 50  
The port priority is 50 now.
```

## link-aggregation group

#### Syntax

**link-aggregation group** *agg-id*  
**no link-aggregation group**

#### View

Ethernet port view.

#### Parameters

*agg-id*: aggregation group ID, in a range from 1 to 13.

#### Description

Use **link-aggregation group** command to add the Ethernet port to a manual or static aggregation group.  
Use **no link-aggregation group** command to remove the Ethernet port from the aggregation group.

#### Examples

```
XS(Ethernet0/1)# no link-aggregation group  
The port is deleted from the link-aggregation group!
```

```
XS(Ethernet0/1)# link-aggregation group 1  
The port is added into the link-aggregation group!
```

## 3.10 Mirroring Commands

The “Any view” in the below table refers to anyone of the following: System view, Ethernet port view, Port-based VLAN view, VLAN view, or dot1x view.

### Command list:

| View              | Command   |
|-------------------|---|
| System view       | <a href="#"><b>mirror group</b> <i>groupid</i></a>  |
| mirror group view | <a href="#"><b>no mirror-group</b></a>  |
| Any view          | <a href="#"><b>show mirror</b></a>  |
| mirror group view | <a href="#"><b>monitor-port ethernet</b> <i>interface</i></a>   |
| mirror group view | <a href="#"><b>mirroring-port ethernet</b> <i>interface</i> [<b>to ethernet</b> <i>interface</i>] { <b>both</b>   <b>egress</b>   <b>ingress</b> }<br/><a href="#"><b>no mirroring-port</b> [<b>ethernet</b> <i>interface</i> ]</a></a> |

### mirror group

#### Syntax

```
mirror group groupid
no mirror-group
```

#### View

System view.

#### Parameters

*groupid*: a group ID in the range of 1 to 4.

#### Description

Use **mirror group** command to enter into mirror group configuration environment.  
Use **no mirror group** command to delete all mirror groups.

#### Examples

```
XS# mirror group 1
XS(MIRROR-1)#
```

### mirror-group

#### Syntax

```
no mirror-group
```

#### View

mirror group view.

#### Parameters

None.

#### Description

Use **no mirror-group** command to delete all mirror groups.

#### Examples

XS(MIRROR-1)# no mirror-group  
 The mirror group have been deleted successfully.

## show mirror

### Syntax

**show mirror**

### View

Any view.

### Parameters

None.

### Description

Use **show mirror** command to display the port mirroring configurations.

### Examples

```
XS# show mirror
Group ID: 1
Mirror State: Enabled
Monitor-port:Ethernet0/1
Mirroring-port:
Ethernet0/2    both

Group ID: 2
Mirror State: Disabled

Group ID: 3
Mirror State: Disabled

Group ID: 4
Mirror State: Disabled
```

## monitor-port

### Syntax

**monitor-port ethernet** *interface*

### View

System view.

### Parameters

*interface* : ethernet port, in the form of interface = { interface-type/interface-number}, interface-type = {0 | 1}, when interface-type is 0, interface-number = { 1 | 2 | ... | 24 }, when interface-type is 1, interface-number = { 1 | 2 }.

### Description

Use **monitor-port** command to configure the destination port. You can use **to ethernet interface** to configure a range of continuous destination ports.

#### Examples

```
XS(MIRROR-1)# monitor-port ethernet 0/20
Configuration completed successfully.
```

## mirroring-port

#### Syntax

```
mirroring-port ethernet interface [ to ethernet interface ] {both | egress |
ingress}
no mirroring-port [ ethernet interface ]
```

#### View

System view.

#### Parameters

*interface* : ethernet port, in the form of *interface = { interface-type/interface-number}*, *interface-type* = {0 | 1}, when *interface-type* is 0, *interface-number* = { 1 | 2 | ... | 24 }, when *interface-type* is 1, *interface-number* = { 1 | 2}.

**to**: specifies the last port number of the range.

**both**: specified to mirror all packets received on and sent from the port.

**ingress**: specified to mirror the packets received on the port.

**egress**: specified to mirror the packets sent from the port.

#### Description

Use **mirroring-port** command to configure the source port. You can use **to ethernet interface** to configure a range of continuous source ports.

Use **no mirroring-port** command to remove the configuration from the source port(s). If no Ethernet interface is specified, all configured mirror ports are removed.

#### Examples

```
XS(MIRROR-1)# mirroring-port ethernet 0/7 both
Configuration completed successfully.
XS(MIRROR-1)# mirroring-port ethernet 0/8 to ethernet 0/12 both
Configuration completed successfully.
XS(MIRROR-1)# no mirroring-port ethernet 0/3
Configuration completed successfully.
```

## 3.11 VLAN Commands

### 3.11.1 VLAN Configuration Commands

The "Any view" in the below table refers to anyone of the following: System view, Ethernet port view, Port-based VLAN view, VLAN view, or dot1x view.

#### Command list:

| View               | Command   |
|--------------------|---|
| Any view           | <b>show vlan-mode</b>   |
| Any view           | <b>show vlan { all   dynamic   static   vlan-id1 [ to vlan-id2 ] }</b>  |
| System view        | <b>vlan-mode { none   port-based   8021Q }</b>  |
| System view        | <b>vlan vlan-id</b><br><b>no vlan { all   vlan-id1 [ to vlan-id2 ] }</b>  |
| VLAN view          | <b>end</b>  |
| VLAN view          | <b>description name</b>   |
| VLAN view          | <b>switchport { forbidden   tagged   untagged }</b><br><b>ethernet interface [ to ethernet interface ]</b><br><b>no switchport { forbidden   tagged   untagged }</b><br><b>ethernet interface [ to ethernet interface ]</b> |
| VLAN view          | <b>protocol-vlan { at   ip   ipx   mode ethernetii etype-id }</b><br><b>no protocol-vlan { at   ip   ipx   mode ethernetii etype-id }</b>   |
| VLAN view          | <b>mac-based-vlan mac mac-address priority priority</b><br><b>no mac-based-vlan mac mac-address</b>   |
| VLAN view          | <b>unknown-multicast-flood</b><br><b>no unknown-multicast-flood</b>   |
| VLAN view          | <b>igmp-snooping</b><br><b>no igmp-snooping</b>   |
| VLAN view          | <b>show igmp-snooping vlan { vlan-id1 [ to vlan-id2 ] }</b>   |
| Ethernet port view | <b>switchport pvid vlan-id</b><br><b>no switchport pvid</b>   |
| Ethernet port view | <b>switchport link-type { access   hybrid   trunk }</b><br><b>no switchport link-type</b>   |
| Ethernet port view | <b>switchport admit-frame { all   only-tag }</b><br><b>no switchport admit-frame</b>  |
| Ethernet port view | <b>switchport protected</b><br><b>no switchport protected</b>   |
| Ethernet port view | <b>switchport ingress-filtering</b><br><b>no switchport ingress-filtering</b>   |

## show vlan-mode

### Syntax

**show vlan-mode**

### View

Any view.

### Parameters

None.

### Description

Use **show vlan-mode** to display the current setting of vlan mode. By default, vlan mode is No VLAN.

### Examples

XS# **show vlan-mode**  
Current vlan mode is 8021Q vlan.

## show vlan

### Syntax

```
show vlan { all | dynamic | static | vlan-id1 [ to vlan-id2 ] }
```

### View

Any view.

### Parameters

*vlan-id1*: specifies the ID of a VLAN the information of which is to be displayed, in the range of 1 to 4094.

**to** *vlan-id2*: in conjunction with *vlan-id1*, defines a VLAN range to display information of all existing VLANs in the range. The *vlan-id2* argument takes a value in the range of 1 to 4094, and must not be less than that of *vlan-id1*.

**all**: displays information of all the VLANs.

**dynamic**: displays the number of dynamic VLANs and the ID of each dynamic VLAN. Dynamic VLANs refer to VLANs that are generated through GVRP.

**static**: displays the number of static VLANs and the ID of each static VLAN. Static VLANs refer to VLANs manually created.

### Description

Use **show vlan** command to display information of VLANs, including ID, type, VLAN interface state and member ports of a VLAN.

### Examples

```
XS# show vlan static
```

```
VLAN ID: 1
```

```

## vlan-mode

### Syntax

**vlan-mode { none | port-based | 8021Q }**

### View

System view.

### Parameters

**none**: disabled VLAN function.  
**port-based**: allows port based VLAN.  
**8021Q**: allows 802.1q VLAN.

### Description

Use **vlan-mode** to set a vlan mode.  
 By default, vlan mode is No VLAN.

### Examples

```
XS# vlan-mode port-based
Config port based vlan successfully!
```

## vlan

### Syntax

**vlan** *vlan-id*  
**no vlan** { **all** | *vlan-id1* [ **to** *vlan-id2* ] }

### View

System view.

### Parameters

*vlan-id*: specifies the ID of a VLAN the information of which is to be created, in a range from 1 to 4094.  
*vlan-id1*: specifies the ID of a VLAN the information of which is to be deleted, in the range of 1 to 4094.  
**to** *vlan-id2*: in conjunction with *vlan-id1*, defines a VLAN range to delete information of all existing VLANs in the range. The *vlan-id2* argument takes a value in the range of 1 to 4094, and must not be less than that of *vlan-id1*.

**all**: deletes all VLANs.

#### Description

Use **vlan** command to enter into vlan configuration environment.  
Use **no vlan** command to delete all VLANs or specified VLAN(s).

#### Examples

```
XS# vlan 2  
XS(vlan2)#
```

## end

#### Syntax

**end**

#### View

VLAN view.

#### Parameters

None.

#### Description

Use **end** command to exit from the vlan configuration environment.

#### Examples

```
XS(vlan2)# end  
XS#
```

## description

#### Syntax

**description** *name*

#### View

VLAN view.

#### Parameters

*name*: VLAN name, a description of 1 to 255 characters. It can contain special characters, but cannot be spaces.

#### Description

Use **description** command to assign a name to the VLAN.  
By default, the name of a VLAN is its VLAN ID, **VLAN0001** for example.

#### Examples

```
XS(vlan2)# description test2222  
set vlan group description successfully!!!
```

## switchport

### Syntax

```
switchport { forbidden | tagged | untagged } ethernet interface [ to
ethernet interface ]
no switchport { forbidden | tagged | untagged } ethernet interface [ to
ethernet interface ]
```

### View

VLAN view.

### Parameters

**forbidden**: does not allow the port to be added to the VLAN group, even if GARP indicates so.

**tagged**: indicates the port is a tagged member of the VLAN group. All packets forwarded by the port are tagged. The packets contain VLAN information.

**untagged**: indicates the port is an untagged VLAN member of the VLAN group. Packets forwarded by the port are untagged.

*interface*: port number. Ethernet ports to be added to or removed from the current VLAN.

**to**: specifies the last port number of the range.

### Description

Use **switchport** command to add forbidden, tagged or untagged port to the VLAN. Use **no switchport** command to delete forbidden, tagged or untagged port from the VLAN.

### Examples

```
XS(vlan5)# switchport tagged ethernet 0/8 to ethernet 0/15
Ethernet0/8 belongs to a trunk. The other member in the same trunk will be added
to this vlan as well!
Add tagged ports successfully!
```

```
XS(vlan5)# no switchport tagged ethernet 0/8 to ethernet 0/15
Ethernet0/8 belongs to a trunk. The other member in the same trunk will be
removed from this vlan!
Delete tagged ports successfully!
```

## protocol-vlan

### Syntax

```
protocol-vlan { at | ip | ipx | mode ethernetii etype-id }
no protocol-vlan { at | ip | ipx | mode ethernetii etype-id }
```

### View

VLAN view.

### Parameters

**at**: creates the AppleTalk-based protocol template.

**ip**: creates the IP-based protocol template.

**ipx**: creates the IPX-based protocol template.  
**mode**: configures a user-defined protocol template.  
**ethernetii** *etype-id*: creates the protocol template that matches the Ethernet II encapsulation format and the corresponding protocol type value of the packet. The *etype-id* argument indicates the protocol type value and ranges from 0x0600 to 0xFFFF (excluding 0x0800, 0x8137, and 0x809b).

#### Description

Use **protocol-vlan** command to configure the protocol template used for classifying protocol-based VLANs.  
 Use **no protocol-vlan** command to disable the configuration.  
 By default, no protocol template is configured.

#### Examples

```
XS(vlan5)# protocol-vlan 1 mode ethernetii 0x8899
Settings are updated successfully!
```

## mac-based-vlan

#### Syntax

```
mac-based-vlan mac mac-address priority priority
no mac-based-vlan mac mac-address
```

#### View

VLAN view.

#### Parameters

**mac-address**: LLC address.  
**priority**: vlan tag header priority.

#### Description

Use **mac-based-vlan** command to configure the mac-address used for classifying mac-based VLANs.  
 Use **no mac-based-vlan** command to delete the configuration.  
 By default, no mac-address is configured.

#### Examples

```
XS(vlan5)# mac-based-vlan mac 00-11-22-33-44-55 priority 0
Setting successfully
XS(vlan5)#
XS(vlan5)# no mac-based-vlan mac 00-11-22-33-44-55
Delete successfully
```

## unknown-multicast-flood

#### Syntax

```
unknown-multicast-flood
no unknown-multicast-flood
```

#### View

VLAN view.

#### Parameters

None.

#### Description

Use **unknown-multicast-flood** command to enable the Unknown Multicast Flood Status for this VLAN group.

Use **no unknown-multicast-flood** command to disable the Unknown Multicast Flood Status for this VLAN group.

By default, no unknown-multicast-flood is configured.

#### Examples

```
XS(vlan5)# unknown-multicast-flood
XS(vlan5)# no unknown-multicast-flood
```

## igmp-snooping

#### Syntax

```
igmp-snooping
no igmp-snooping
```

#### View

VLAN view.

#### Parameters

None.

#### Description

Use **igmp-snooping** command to enable the igmp snooping function for this VLAN group.

Use **no igmp-snooping** command to enable the igmp snooping function for this VLAN group.

By default, no igmp-snooping is configured.

#### Examples

```
XS(vlan5)# igmp-snooping
Igmp-snooping has been enabled on vlan 5
```

```
XS(vlan5)# no igmp-snooping
Igmp-snooping has been disabled in this vlan group 5.
```

## show igmp-snooping

#### Syntax

```
show igmp-snooping vlan{ vlan-id1 [ to vlan-id2 ] }
```

### View

VLAN view.

### Parameters

*vlan-id*: specifies the ID of a VLAN the information of which is to be created, in a range from 1 to 4094.

*vlan-id1*: specifies the ID of a VLAN the information of which is to be deleted, in the range of 1 to 4094.

**to** *vlan-id2*: in conjunction with *vlan-id1*, defines a VLAN range to delete information of all existing VLANs in the range. The *vlan-id2* argument takes a value in the range of 1 to 4094, and must not be less than that of *vlan-id1*.

### Description

Use **show igmp-snooping** command to display the igmp snooping configuration for the specified VLAN group.

### Examples

```
XS(vlan5)# show igmp-snooping vlan 5
show igmp-snooping configuration on vlan 5
Igmp-snooping state: Enabled
VLAN route interface:
Ethernet0/7
Ethernet0/8
```

## switchport pvid

### Syntax

```
switchport pvid vlan-id
no switchport pvid
```

### View

Ethernet port view

### Parameters

*vlan-id*: specifies the default VLAN ID of the port, in a range from 1 to 4094.

### Description

Use **switchport pvid** command to set the default VLAN ID for the port. A trunk port sends packets of the default VLAN untagged.

Use **no switchport pvid** command to restore the default.

By default, the default VLAN ID of a port is VLAN 1.

### Examples

```
XS(Ethernet0/9)# switchport pvid 5
Setting successfully
```

## switchport link-type

### Syntax

**switchport link-type { access | hybrid | trunk }**  
**no switchport link-type**

View

Ethernet port view

Parameters

**access**: sets the port link type to access.

**hybrid**: sets the port link type to hybrid.

**trunk**: sets the port link type to trunk.

Description

Use **switchport link-type** command to set link type of the Ethernet port.

Use **no switchport link-type** command to restore the default link type.

The default link type of an Ethernet port is **hybrid**.

Examples

```
XS(Ethernet0/9)# switchport link-type trunk  
Set successfully
```

## switchport admit-frame

Syntax

**switchport admit-frame { all | only-tag }**  
**no switchport admit-frame**

View

Ethernet port view

Parameters

**all**: the port accepts all ingress packages

**only-tag**: the port accepts tagged packages, and discards untagged ones.

Description

Use **switchport admit-frame** command to configure how the port accepts ingress packages.

Use **no switchport admit-frame** command to restore the default admit-frame type on a port.

By default, the admit-frame type is **all**.

Examples

```
XS(Ethernet0/9)# switchport admit-frame only-tag  
Set successfully
```

## switchport protected

Syntax

**switchport protected**  
**no switchport protected**

View

Ethernet port view

Parameters

None.

Description

Use **switchport protected** command to enable switchport protected function for the specified switch interface.

Use **no switchport protected** command to disable switchport protected function for the specified switch interface.

By default, the switchport protected is configured.

Examples

```
XS(Ethernet0/9)# switchport protected
Port ethernet0/9 has been protected.
```

```
XS(Ethernet0/9)# no switchport protected
Port ethernet0/9 has been normal.
```

## switchport ingress-filtering

Syntax

**switchport ingress-filtering**  
**no switchport ingress-filtering**

View

Ethernet port view

Parameters

None.

Description

Use **switchport ingress-filtering** command to enable switchport ingress-filtering function for the specified switch interface.

Use **no switchport ingress-filtering** command to disable switchport ingress-filtering function for the specified switch interface.

By default, the switchport ingress-filtering is configured.

Examples

```
XS(Ethernet0/9)# switchport ingress-filtering
Ingress-filtering has been enabled successfully!
XS(Ethernet0/9)# no switchport ingress-filtering
```

Ingress-filtering has been disabled successfully!

### 3.11.2 Port-Based VLAN Configuration Commands

The “Any view” in the below table refers to anyone of the following: System view, Ethernet port view, Port-based VLAN view, VLAN view, or dot1x view.

**Command list:**

| View                 | Command   |
|----------------------|---|
| Any view             | <a href="#"><u>show port-based-vlan { all   vlan-id1 [ to vlan-id2 ] }</u></a>  |
| System view          | <a href="#"><u>port-based-vlan vlan-id</u></a><br><a href="#"><u>no port-based-vlan { all   vlan-id1 [ to vlan-id2 ] }</u></a>                                    |
| Port-based VLAN view | <a href="#"><u>end</u></a>  |
| Port-based VLAN view | <a href="#"><u>description name</u></a>   |
| Port-based VLAN view | <a href="#"><u>interface ethernet interface [ to ethernet interface ]</u></a><br><a href="#"><u>no interface ethernet interface [ to ethernet interface ]</u></a> |

#### show port-based-vlan

**Syntax**

**show port-based-vlan { all | vlan-id1 [ to vlan-id2 ] }**

**View**

Any view.

**Parameters**

- vlan-id1*: specifies the ID of a VLAN the information of which is to be displayed, in the range of 1 to 255.
- to** *vlan-id2*: in conjunction with *vlan-id1*, defines a VLAN range to display information of all existing VLANs in the range. The *vlan-id2* argument takes a value in the range of 1 to 255, and must not be less than that of *vlan-id1*.
- all**: displays information of all the VLANs.

**Description**

Use **show port-based-vlan** command to display information of port based VLANs, including ID, description and member ports of a VLAN.

**Examples**

```
XS# show port-based-vlan 1 to 2

VLAN ID: 1
Description: vlan1
Member Ports:
Ethernet0/9      Ethernet0/10      Ethernet0/11
Ethernet0/12

VLAN ID: 2
Description: vlan2
Member Ports:
```

Ethernet0/12

Ethernet0/13

Ethernet0/14

## port-based-vlan

### Syntax

```
port-based-vlan vlan-id  
no port-based-vlan { all | vlan-id1 [ to vlan-id2 ] }
```

### View

System view.

### Parameters

*vlan-id*: specifies the ID of a VLAN the information of which is to be created, in the range of 1 to 255.

*vlan-id1*: specifies the ID of a VLAN the information of which is to be deleted, in the range of 1 to 255.

**to** *vlan-id2*: in conjunction with *vlan-id1*, defines a VLAN range to delete information of all existing VLANs in the range. The *vlan-id2* argument takes a value in the range of 1 to 255, and must not be less than that of *vlan-id1*.

**all**: deletes all port based VLANs.

### Description

Use **port-based-vlan** command to enter into the port-based vlan configuration environment.

Use **no port-based-vlan** command to delete all port-based VLANs or specified VLAN(s).

### Examples

```
XS# port-based-vlan 3  
XS(port-based-vlan-3)#
```

## end

### Syntax

```
end
```

### View

Port-based VLAN view.

### Parameters

None.

### Description

Use **end** command to exit from the port-based vlan configuration environment.

### Examples

```
XS(port-based-vlan-3)# end  
XS#
```

## description

### Syntax

**description** *name*

### View

Port-based VLAN view.

### Parameters

*name*: VLAN name, a description of 1 to 255 characters. It can contain special characters, but cannot be spaces.

### Description

Use **description** command to assign a name to the VLAN.  
By default, the name of a VLAN is its VLAN ID, **VLAN0001** for example.

### Examples

```
XS(port-based-vlan-3)# description vlan*8*3
XS(port-based-vlan-3)#
```

## interface ethernet

### Syntax

**interface ethernet** *interface* [ **to ethernet** *interface* ]  
**no interface ethernet** *interface* [ **to ethernet** *interface* ]

### View

Port-based VLAN view.

### Parameters

*interface*: port number, Ethernet port to be added to or removed from the VLAN.  
**to**: in conjunction with the other parameter to define a range of ports to add to or remove from the VLAN.

### Description

Use **interface** command to assign one or multiple ports to the VLAN.  
Use **no interface** command to remove the specified port(s) from the VLAN.

### Examples

```
XS(port-based-vlan-4)# interface ethernet 0/2 to ethernet 0/24
Ethernet0/2 belongs to a trunk. The other member in the same trunk will be added
to this vlan!
Add the port successfully.
```

```
XS(port-based-vlan-4)# no interface ethernet 0/2 to ethernet 0/24
Ethernet0/2 belongs to a trunk. The other member in the same trunk will be
removed from this vlan!
Delete the port successfully.
```

## 3.12 VLAN VPN

The “Any view” in the below table refers to anyone of the following: System view, Ethernet port view, Port-based VLAN view, VLAN view, or dot1x view.

### Command list:

| View                              | Command   |
|-----------------------------------|---|
| Any view                          | <a href="#">show vlan-vpn</a>   |
| System view                       | <a href="#">vlan-vpn</a><br><a href="#">no vlan-vpn</a>   |
| System view                       | <a href="#">vlan-vpn tpid tpid</a><br><a href="#">no vlan-vpn tpid tpid</a>   |
| System view<br>Ethernet port view | <a href="#">vlan-vpn QinQ ethernet ethernet-port priority priority new-vid new-vid old-vid old-vid to old-end-vid</a><br><a href="#">no vlan-vpn QinQ ethernet ethernet-port new-vid new-vid old-vid old-vid to old-end-vid</a> |

### show vlan-vpn

#### Syntax

**show vlan-vpn**

#### View

Any view.

#### Parameters

None.

#### Description

Use show vlan-vpn command to display the settings of the vlan-vpn of all ports. This command displays the following settings:

- Global vlan-vpn status
- Vlan-vpn per Ethernet port
- QinQ

#### Examples

```
XS# show vlan-vpn
```

```
Global vlan-vpn Status:Disabled
Port          Vlan-vpn State  Tpid
-----
Ethernet0/1   Disabled        0x8100
Ethernet0/2   Disabled        0x8100
Ethernet0/3   Disabled        0x8100
Ethernet0/4   Disabled        0x8100
Ethernet0/5   Disabled        0x8100
Ethernet0/6   Disabled        0x8100
Ethernet0/7   Disabled        0x8100
Ethernet0/8   Disabled        0x8100
Ethernet0/9   Disabled        0x8100
```

|              |          |        |
|--------------|----------|--------|
| Ethernet0/10 | Disabled | 0x8100 |
| Ethernet0/11 | Disabled | 0x8100 |
| Ethernet0/12 | Disabled | 0x8100 |
| Ethernet0/13 | Disabled | 0x8100 |
| Ethernet0/14 | Disabled | 0x8100 |
| Ethernet0/15 | Disabled | 0x8100 |
| Ethernet0/16 | Disabled | 0x8100 |
| Ethernet0/17 | Disabled | 0x8100 |
| Ethernet0/18 | Disabled | 0x8100 |
| Ethernet0/19 | Disabled | 0x8100 |
| Ethernet0/20 | Disabled | 0x8100 |
| Ethernet0/21 | Disabled | 0x8100 |
| Ethernet0/22 | Disabled | 0x8100 |
| Ethernet0/23 | Disabled | 0x8100 |
| Ethernet0/24 | Disabled | 0x8100 |
| Ethernet1/1  | Disabled | 0x8100 |
| Ethernet1/2  | Disabled | 0x8100 |

| New VLAN ID | Old Low VID | Old Hight VID | Priority | Port |
|-------------|-------------|---------------|----------|------|
|-------------|-------------|---------------|----------|------|

-----

## vlan-vpn

### Syntax

```
vlan-vpn
no vlan-vpn
```

### View

System view.

### Parameters

none.

### Description

Use **vlan-vpn** command to enable VLAN-VPN on this switch.  
Use **no vlan-vpn** command to disable VLAN-VPN on this switch.

### Examples

```
XS# vlan-vpn
Vlan-vpn has been enabled successfully.
```

## vlan-vpn tpid

### Syntax

```
vlan-vpn tpid tpid
no vlan-vpn tpid tpid
```

### View

System view.

### Parameters

tpid(Tag Protocol Identifier): includes an Ethernet Type value that is used to identify the frame as a tagged frame and to select the correct tag decoding functions.

### Description

Use **vlan-vpn tpid** command to set a TPID value.  
Use **no vlan-vpn tpid** command to restore to the default setting of TPID.

### Examples

```
XS# vlan-vpn ethernet 0/2 tpid 0x8100
Tpid has been configured successfully.
```

## vlan-vpn QinQ

### Syntax

**vlan-vpn QinQ ethernet** *ethernet-port* **priority** *priority* **new-vid** *new-vid*  
**old-vid** *old-vid* **to** *old-end-vid*  
**no vlan-vpn QinQ ethernet** *ethernet-port* **new-vid** *new-vid* **old-vid** *old-vid* **to**  
*old-end-vid*

### View

System view.

### Parameters

*interface* : *ethernet port*, in the form of *interface = { interface-type/interface-number}*, *interface-type* = {0 | 1}, when *interface-type* is 0, *interface-number* = { 1 | 2 | ... | 24 }, when *interface-type* is 1, *interface-number* = { 1 | 2 }.

**priority**: the outer VLAN priority, in the range from 0 to 7.  
**new-vid**: the outer double VLAN ID, in the range from 1 to 4094.  
**old-vid**: the incoming VLAN ID to be added double tag in the range from 1 to 4094.  
**to old-end-vid**: in conjunction with *old-vid*, defines a VLAN ID range to be added double tag.

### Description

Use **vlan-vpn QinQ** command to set a double tag on the incoming VLAN.  
Use **no vlan-vpn QinQ** command to delete the QinQ configuration.

### Examples

```
XS# vlan-vpn QinQ ethernet 0/3 priority 0 new-vid 100 old-vid 3 to 4
Configure QinQ successfully.
```

## 3.13 GVRP Commands

The "Any view" in the below table refers to anyone of the following: System view, Ethernet port view, Port-based VLAN view, VLAN view, or dot1x view.

**Command list:**

| View               | Command   |
|--------------------|---|
| Any view           | <a href="#">show garp timer</a>   |
| Any view           | <a href="#">show gvrp status</a>  |
| System view        | <a href="#">garp timeout {hold   join   leave   leaveall } timer-value</a><br><a href="#">no garp timeout {hold   join   leave   leaveall } timer-value</a> |
| System view        | <a href="#">gvrp</a>  |
| Ethernet port view | <a href="#">no gvrp</a>   |
| Ethernet port view | <a href="#">gvrp registration { fixed   forbidden   normal }</a><br><a href="#">no gvrp registration</a>  |

## show garp timer

### Syntax

**show garp timer**

### View

Any view.

### Parameters

None.

### Description

Use **show garp timer** command to display the settings of the GARP timer of all ports.

This command displays the settings of the following timers:

- Join timer
- Leave timer
- LeaveAll timer
- Hold timer

### Examples

XS# **show garp timer**

```

Join      Leave   Leave-all  Hold
-----
200       600     10000      10
    
```

## show gvrp status

### Syntax

**show gvrp status**

### View

Any view.

### Parameters

None.

### Description

Use **show gvrp status** command to display the GVRP settings of all ports.

### Examples

XS# **show gvrp status**

Gvrp feature is currently enabled on this switch!

| Ports        | Gvrp-status | Registration |
|--------------|-------------|--------------|
| Ethernet0/1  | Disabled    | Normal       |
| Ethernet0/2  | Disabled    | Normal       |
| Ethernet0/3  | Disabled    | Normal       |
| Ethernet0/4  | Disabled    | Normal       |
| Ethernet0/5  | Disabled    | Normal       |
| Ethernet0/6  | Disabled    | Normal       |
| Ethernet0/7  | Disabled    | Normal       |
| Ethernet0/8  | Disabled    | Normal       |
| Ethernet0/9  | Disabled    | Normal       |
| Ethernet0/10 | Disabled    | Normal       |
| Ethernet0/11 | Disabled    | Normal       |
| Ethernet0/12 | Disabled    | Normal       |
| Ethernet0/13 | Disabled    | Normal       |
| Ethernet0/14 | Disabled    | Normal       |
| Ethernet0/15 | Disabled    | Normal       |
| Ethernet0/16 | Disabled    | Normal       |
| Ethernet0/17 | Disabled    | Normal       |
| Ethernet0/18 | Disabled    | Normal       |
| Ethernet0/19 | Disabled    | Normal       |
| Ethernet0/20 | Disabled    | Normal       |
| Ethernet0/21 | Disabled    | Normal       |
| Ethernet0/22 | Disabled    | Normal       |
| Ethernet0/23 | Disabled    | Normal       |
| Ethernet0/24 | Disabled    | Normal       |
| Ethernet1/1  | Disabled    | Normal       |
| Ethernet1/2  | Disabled    | Normal       |

## garp timeout

### Syntax

**garp timeout {hold | join | leave | leaveall } timer-value**  
**no garp timeout {hold | join | leave | leaveall } timer-value**

### View

System view.

### Parameters

**hold:** sets the GARP Hold timer. The argument ranges from 10 to 2147483640.

**join:** sets the GARP Join timer. The argument ranges from 10 to 2147483640, and the default value is 200 milliseconds.

**leave:** sets the GARP Leave timer. The argument ranges from 10 to 2147483640, and the default value is 600 milliseconds.

**leaveall:** sets the GARP Leaveall timer. The argument ranges from 10 to

2147483640, the default value is 10000 milliseconds.  
*timer-value*: timeout time (in milliseconds) of the GARP timer (Hold, Join, Leave or Leaveall ) to be set.

#### Description

Use **garp timeout** command to set a GARP timer.  
Use **no garp timeout** command to restore to the default setting of a GARP timer.

#### Examples

```
XS# garp timeout leaveall 20000  
Configure successfully.
```

## **gvrp**

#### Syntax

```
gvrp  
no gvrp
```

#### View

System view.  
Ethernet port view.

#### Parameters

None.

#### Description

Use **gvrp** command to enable GVRP globally (in System view) or for a port (in Ethernet port view).  
Use **no gvrp** command to disable GVRP globally (in System view) or for a port (in Ethernet port view).  
By default, GVRP is disabled both globally and on a port.

#### Examples

```
XS(Ethernet0/1)# gvrp  
Enable this interface gvrp successfully.
```

## **gvrp registration**

#### Syntax

```
gvrp registration {fixed | forbidden | normal}  
no gvrp registration
```

#### View

Ethernet port view

#### Parameters

**fixed**: specifies the fixed GVRP registration mode. A port operating in this mode cannot register or deregister VLAN information dynamically. It only propagates static VLAN information. Besides, the port permits only static VLANs, that is, it

propagates only static VLAN information to the other GARP members.

**forbidden**: specifies the forbidden GVRP registration mode. A port operating in this mode cannot register or deregister VLAN information dynamically. It permits only VLAN 1, that is, it propagates only the information of VLAN 1 to the other GARP members.

**normal**: specifies the normal mode. A port operating in this mode can register or deregister VLAN information dynamically, and can propagate both dynamic and static VLAN information.

### Description

Use **gvrp registration** command to configure the GVRP registration mode on a port.

Use **no gvrp registration** command to restore to the default GVRP registration mode on a port.

By default, the GVRP registration mode is **normal**.

### Examples

XS(Ethernet0/1)# **gvrp registration fixed**  
 forbid registering vlan dynamically or logging out of vlan, only allow transmitting vlan information statically.

## 3.14 QoS Commands

The “Any view” in the below table refers to anyone of the following: System view, Ethernet port view, Port-based VLAN view, VLAN view, or dot1x view.

### Command list:

| View               | Command   |
|--------------------|---|
| Any view           | <a href="#">show qos queue-scheduler</a>  |
| Any view           | <a href="#">show qos cos-local-precedence-map</a>   |
| Any view           | <a href="#">show qos map dscp cos</a>   |
| Any view           | <a href="#">show qos interface [ ethernet interface ]</a>   |
| System view        | <a href="#">qos queue-scheduler {strict-priority   wrr queue0-weight queue1-weight queue2-weight queue3-weight }</a><br><a href="#">no qos queue-scheduler</a>  |
| System view        | <a href="#">qos cos-local-precedence-map cos0-map-local-prec cos1-map-local-prec cos2-map-local-prec cos3-map-local-prec cos4-map-local-prec cos5-map-local-prec cos6-map-local-prec cos7-map-local-prec</a><br><a href="#">no qos cos-local-precedence-map</a> |
| System view        | <a href="#">qos map dscp dscp to cos cos</a><br><a href="#">no qos map dscp dscp</a>  |
| Ethernet port View | <a href="#">qos-mode dscp</a><br><a href="#">no qos-mode dscp</a>   |
| Ethernet port View | <a href="#">priority priority-level</a><br><a href="#">no priority</a>  |

### show qos queue-scheduler

### Syntax

**show qos queue-scheduler**

### View

Any view.

### Parameters

None.

### Description

Use **show qos queue-scheduler** command to display the global queue scheduling configuration.

### Examples

```
XS# show qos queue-scheduler
Queue scheduling mode: weighted round robin
weight of queue 0: 2
weight of queue 1: 5
weight of queue 2: 7
weight of queue 3: 8
```

## show qos cos-local-precedence-map

### Syntax

**show qos cos-local-precedence-map**

### View

Any view.

### Parameters

None.

### Description

Use **show qos cos-local-precedence-map** command to display the 802.1p priority-to-local precedence mapping, illustrated by an 802.1p priority to local precedence mapping table as shown in the following example.

After a packet enters a switch, the switch sets the 802.1p priority and local precedence for the packet according to its own capability and the corresponding rules. The local precedence is locally significant precedence that the switch assigns to the packet. It corresponds to an output queue. Packets with higher local precedence values take precedence over those with lower precedence values and will be processed preferentially.

### Examples

```
XS# show qos cos-local-precedence-map
cos-local-precedence-map:
cos(802.1p)  :0  1  2  3  4  5  6  7
```

queue :0 0 1 1 2 2 3 3

## show qos map dscp cos

### Syntax

**show qos map dscp cos**

### View

Any view.

### Parameters

None.

### Description

Use **show qos map dscp cos** command to display the mapping of DSCP priority to 802.1p priority, illustrated by a DSCP priority to 802.1p priority mapping table as shown in the following example.

### Examples

```
XS# show qos map dscp cos
Dscp-cos map:
d1 : d2 0 1 2 3 4 5 6 7 8 9
0 : 0 0 0 0 0 0 0 0 0 1 1
1 : 1 1 1 1 1 1 2 2 2 2
2 : 2 2 2 2 3 3 3 3 3 3
3 : 3 3 4 4 4 4 4 4 4 4
4 : 5 5 5 5 5 5 5 5 6 6
5 : 6 6 6 6 6 6 7 7 7 7
6 : 7 7 7 7
```

## show qos interface

### Syntax

**show qos interface [ ethernet interface ]**

### View

Any view.

### Parameters

**ethernet interface**: displays the qos information of a specified port.  
*interface* : ethernet port, in the form of *interface* = { *interface-type/interface-number* }, *interface-type* = {0 | 1}, when *interface-type* is 0, *interface-number* = { 1 | 2 | ... | 24 }, when *interface-type* is 1, *interface-number* = { 1 | 2 }..

### Description

Use **show qos interface** command to display the QoS information of all Ethernet ports or a specified port.

### Examples

```
#display the qos information of all ports
XS# show qos interface
```

| PORT         | DEFAULT PRIORITY | DSCP     |
|--------------|------------------|----------|
| Ethernet0/1  | 0                | disabled |
| Ethernet0/2  | 0                | disabled |
| Ethernet0/3  | 0                | disabled |
| Ethernet0/4  | 0                | disabled |
| Ethernet0/5  | 0                | disabled |
| Ethernet0/6  | 0                | disabled |
| Ethernet0/7  | 0                | disabled |
| Ethernet0/8  | 0                | disabled |
| Ethernet0/9  | 0                | disabled |
| Ethernet0/10 | 0                | disabled |
| Ethernet0/11 | 0                | disabled |
| Ethernet0/12 | 0                | disabled |
| Ethernet0/13 | 0                | disabled |
| Ethernet0/14 | 0                | disabled |
| Ethernet0/15 | 0                | disabled |
| Ethernet0/16 | 0                | disabled |
| Ethernet0/17 | 0                | disabled |
| Ethernet0/18 | 0                | disabled |
| Ethernet0/19 | 0                | disabled |
| Ethernet0/20 | 0                | disabled |
| Ethernet0/21 | 0                | disabled |
| Ethernet0/22 | 0                | disabled |
| Ethernet0/23 | 0                | disabled |
| Ethernet0/24 | 0                | disabled |
| Ethernet1/1  | 0                | disabled |
| Ethernet1/2  | 0                | disabled |

```
#display the qos information of Ethernet port 0/1
XS# show qos interface ethernet 0/1
```

| PORT        | DEFAULT PRIORITY | DSCP     |
|-------------|------------------|----------|
| Ethernet0/1 | 0                | disabled |

## qos queue-scheduler

### Syntax

```
qos queue-scheduler {strict-priority | wrr queue0-weight queue1-weight  
queue2-weight queue3-weight}  
no qos queue-scheduler
```

### View

System view.

### Parameters

**strict-priority**: uses the Strict Priority (SP) algorithm for queue scheduling.  
**wrr**: uses the Weighted Round Robin (WRR) algorithm for queue scheduling.  
*queue0-weight queue1-weight queue2-weight queue3-weight*: customizes the weights to be assigned to queues 0 through 3. The value ranges from 0 to 55. A value of 0 means the corresponding queue adopts the SP algorithm for queue scheduling.

## Description

Use **qos queue-scheduler** command to configure the queue scheduling algorithm and the related parameters.

Use **no qos queue-scheduler** command to restore to the default setting.  
By default, the SP algorithm is used for all output queues of a port.

## Examples

```
XS# qos queue-scheduler wrr 1 2 3 4
The configuration is successful.
```

## qos cos-local-precedence-map

### Syntax

```
qos cos-local-precedence-map cos0-map-local-prec cos1-map-local-prec
cos2-map-local-prec cos3-map-local-prec cos4-map-local-prec
cos5-map-local-prec cos6-map-local-prec cos7-map-local-prec
no qos cos-local-precedence-map
```

### View

System view.

### Parameters

*cos0-map-local-prec*: Local precedence to which 802.1p 0 is to be mapped, in the range 0 to 3.

*cos1-map-local-prec*: Local precedence to which 802.1p 1 is to be mapped, in the range 0 to 3.

*cos2-map-local-prec*: Local precedence to which 802.1p 2 is to be mapped, in the range 0 to 3.

*cos3-map-local-prec*: Local precedence to which 802.1p 3 is to be mapped, in the range 0 to 3.

*cos4-map-local-prec*: Local precedence to which 802.1p 4 is to be mapped, in the range 0 to 3.

*cos5-map-local-prec*: Local precedence to which 802.1p 5 is to be mapped, in the range 0 to 3.

*cos6-map-local-prec*: Local precedence to which 802.1p 6 is to be mapped, in the range 0 to 3.

*cos7-map-local-prec*: Local precedence to which 802.1p 7 is to be mapped, in the range 0 to 3.

## Description

Use **qos cos-local-precedence-map** command to configure the mapping between 802.1p priority and local precedence.

Use **no qos cos-local-precedence-map** command to restore to default settings.  
The following table lists the default 802.1p priority-to-local precedence mapping.

| 802.1p priority | Local precedence |
|-----------------|------------------|
| 0               | 0                |
| 1               | 0                |
| 2               | 1                |
| 3               | 1                |
| 4               | 2                |

|   |   |
|---|---|
| 5 | 2 |
| 6 | 3 |
| 7 | 3 |

### Examples

```
XS# qos cos-local-precedence-map 3 3 2 2 1 1 0 0
```

The configuration succeeds.

## qos map

### Syntax

```
qos map dscp dscp to cos cos
```

```
no qos map dscp dscp
```

### View

System view.

### Parameters

**dscp** *dscp*: the DSCP priority, this argument ranges from 0 to 63.

**cos** *cos*: the 802.1p priority, this argument ranges from 0 to 7.

### Description

Use **qos map** command to map a DSCP priority to an 802.1p priority.

Use **no qos map** command to restore to default settings.

The default DSCP priority to 802.1p priority mapping is 0.

### Examples

```
XS# qos map dscp 0 to cos 7
```

The configuration succeeds.

## qos-mode dscp

### Syntax

```
qos-mode dscp
```

```
no qos-mode dscp
```

### View

Ethernet port view

### Parameters

None.

### Description

Use **qos-mode dscp** command to enable DSCP priority.

Use **no qos-mode dscp** command to disable DSCP priority.

By default, the DSCP priority is disabled.

### Examples

XS(Ethernet0/1)# **qos-mode dscp**  
 Dscp is enabled on port ethernet0/1.

## priority

### Syntax

**priority** *priority-level*  
**no priority**

### View

Ethernet port view

### Parameters

*priority-level*: port priority, ranging from 0 to 7.

### Description

Use **priority** command to set the priority of a port.  
 Use **no priority** command to restore to the default.  
 By default, the priority of an Ethernet port is 0.

After executing **priority** command on a port, the port priority will be used to identify the matching local precedence for the packet (in the 802.1p-priority-to-local-precedence mapping table) regardless of what is the 802.1p priority of each inbound 802.1q-tagged packet. The packet is then assigned to an output queue corresponding to the local precedence.

### Examples

XS(Ethernet0/1)# **no priority**  
 802.1p default priority restored to default 0 on port ethernet0/1

## 3.15 MAC Address Table Management Commands

The “Any view” in the below table refers to anyone of the following: System view, Ethernet port view, Port-based VLAN view, VLAN view, or dot1x view.

### Command list:

| View        | Command  |
|-------------|--|
| Any view    | <a href="#">show mac-address-table</a>   |
| Any view    | <a href="#">show mac-address aging-time</a>  |
| Any view    | <a href="#">show mac-address { static   dynamic   blackhole } [ interface ethernet interface-number ] [ vlan vlan-id ] show mac-address address mac-address [ vlan vlan-id ] [ count ]</a><br><a href="#">show mac-address interface ethernet interface-number [ vlan vlan-id ]</a><br><a href="#">show mac-address vlan vlan-id [ count ]</a><br><a href="#">show mac-address count</a> |
| System view | <a href="#">mac-address { static   dynamic   blackhole } mac-address interface ethernet interface-number vlan</a>  |

|                    |  |
|--------------------|--|
|                    | <a href="#"><i>vlan-id</i></a><br><a href="#"><b>no mac-address { static   dynamic   blackhole }</b></a><br><a href="#"><i>mac-address vlan vlan-id</i></a><br><a href="#"><b>no mac-address interface ethernet interface-number</b></a><br><a href="#"><b>no mac-address vlan vlan-id</b></a><br><a href="#"><b>no mac-address vlan vlan-id mac-address</b></a> |
| Ethernet port view | <a href="#"><b>mac-address { static   dynamic   blackhole }</b></a><br><a href="#"><i>mac-address vlan vlan-id</i></a><br><a href="#"><b>no mac-address { static   dynamic   blackhole }</b></a><br><a href="#"><i>mac-address vlan vlan-id</i></a>  |
| System view        | <a href="#"><b>mac-address timer aging age</b></a><br><a href="#"><b>mac-address timer no-aging</b></a><br><a href="#"><b>no mac-address timer</b></a>   |

## show mac-address-table

### Syntax

**show mac-address-table**

### View

Any view.

### Parameters

None.

### Description

Use **show mac-address-table** command to display information of all MAC address entries in MAC address table, including: MAC address, VLAN and port corresponding to the MAC address, the type (static learned or dynamic) of a MAC address entry, whether a MAC address is within the aging time, and so on.

### Examples

```

XS# show mac-address-table
show the mac address table
MAC ADDRESS      VLAN ID      STATE      PORT      AGING
00-1d-0f-7f-62-18    3      Learned    Ethernet0/7    Yes
00-1d-7d-76-1a-46    3      Learned    Ethernet0/7    Yes
00-80-77-94-dd-92    3      Dynamic    Ethernet0/7    Yes
00-0d-61-45-71-d3    3      Dynamic    Ethernet0/7    Yes
00-1d-7d-74-fa-71    3      Dynamic    Ethernet0/7    Yes
00-1f-d0-6a-df-59    3      Dynamic    Ethernet0/7    Yes
00-0e-1f-01-80-74    3      Learned    Ethernet0/7    Yes
00-1d-7d-44-a8-f7    3      Learned    Ethernet0/7    Yes
00-1d-7d-44-a9-23    3      Learned    Ethernet0/7    Yes
00-1f-d0-6a-de-f0    3      Dynamic    Ethernet0/7    Yes
00-0c-6e-c6-54-85    3      Learned    Ethernet0/7    Yes
00-1d-7d-44-a9-37    3      Learned    Ethernet0/7    Yes
00-0f-ea-4f-36-e5    3      Learned    Ethernet0/7    Yes
00-30-e3-fd-12-98    3      Dynamic    Ethernet0/7    Yes
00-40-63-ca-5b-79    3      Learned    Ethernet0/7    Yes
00-1d-7d-4c-f7-4e    3      Learned    Ethernet0/7    Yes
00-1d-7d-3f-63-ad    3      Learned    Ethernet0/7    Yes
00-1e-68-6a-ae-3d    3      Learned    Ethernet0/7    Yes
00-21-70-b9-62-4f    3      Learned    Ethernet0/7    Yes
    
```

|                        |   |         |             |     |

## show mac-address aging-time

### Syntax

```
show mac-address aging-time
```

### View

Any view.

### Parameters

None.

### Description

Use **show mac-address aging-time** command to display the aging time of the dynamic MAC address entries in MAC address table.

### Examples

```
XS# show mac-address aging-time
The aging time of mac address is 300s.
```

## show mac-address

### Syntax

```
show mac-address { static | dynamic | blackhole } [ interface ethernet
interface-number ] [ vlan vlan-id ]
show mac-address address mac-address [ vlan vlan-id ]
show mac-address interface ethernet interface-number [ vlan vlan-id ]
show mac-address vlan vlan-id [ count ]
show mac-address count
```

### View

Any view.

### Parameters

**static**: displays static MAC address entries.

**dynamic:** displays dynamic MAC address entries.  
**blackhole:** displays blackhole MAC address entries.  
**interface ethernet *interface-number*:** specifies a port by its interface type and number, of which the MAC address entries are displayed.  
**vlan *vlan-id*:** specifies a VLAN by its ID in a range from 1 to 4094, for which the MAC address entries are displayed.  
**address *mac-address*:** specifies a MAC address, in the form of H-H-H-H-H-H.  
**count:** displays the total number of MAC address entries.

## Description

Use **show mac-address** command to display information of certain MAC address entries in MAC address table, including: MAC address, VLAN and port corresponding to the MAC address, the type (static or dynamic) of a MAC address entry, whether a MAC address is within the aging time, and so on.

## Examples

```
#display the static MAC address entries for the vlan 1
XS# show mac-address static vlan 1
MAC ADDRESS      VLAN ID      STATE      PORT      AGING
00-1d-72-23-ed-8f  1           Static     2         No
00-1d-72-23-ed-8e  1           Static     1         No
2 static mac addresses found in 1 vlan
```

```
#display the MAC address entries for the port Ethernet 0/1
XS# show mac-address interface ethernet 0/1
MAC ADDRESS      VLAN ID      STATE      PORT      AGING
00-1d-72-23-ed-8d  1           BlackHole  Ethernet0/1  No
00-1d-72-23-ed-8e  1           Static     Ethernet0/1  No
2 mac addresses found on port Ethernet0/1
```

## mac-address

### Syntax

In System view:

```
mac-address { static | dynamic | blackhole } mac-address interface ethernet interface-number vlan vlan-id
no mac-address { static | dynamic | blackhole } mac-address vlan vlan-id
no mac-address interface ethernet interface-number
no mac-address vlan vlan-id
no mac-address vlan vlan-id mac-address
```

In Ethernet port view:

```
mac-address { static | dynamic | blackhole } mac-address vlan vlan-id
no mac-address { static | dynamic | blackhole } mac-address vlan vlan-id
```

### View

System view, Ethernet port view

### Parameters

**static:** specifies a static MAC address entry.  
**dynamic:** specifies a dynamic MAC address entry.  
**blackhole:** specifies a blackhole MAC address entry.  
*mac-address:* specifies a MAC address, in the form of H-H-H-H-H-H.

**interface ethernet** *interface-number*: specifies the outgoing port by its type and number for the MAC address. All traffic destined for the MAC address will be sent out from the port.

**vlan** *vlan-id*: specifies a VLAN ID, in a range from 1 to 4094. The VLAN must exist.

### Description

Use **mac-address** command to add or modify a MAC address entry.

Use **no mac-address** command to remove one or more MAC address entries.

In Ethernet port view, the MAC address entry configured by **mac-address** command takes the Ethernet port as an outgoing port. If the MAC address you input in the **mac-address** command already exists in the MAC address table, the system will modify the attributes of the corresponding MAC address entry according to your settings in the command.

You can remove all unicast MAC address entries on a port, or remove a specific type of MAC address entries, such as the addresses learnt by the system, dynamic or static MAC address entries configured, or blackhole addresses.

### Examples

```
XS# mac-address dynamic 00-1d-72-23-ed-70 interface ethernet 0/13 vlan 3  
The configuration is successful.
```

```
XS# no mac-address vlan 3  
Delete mac address successfully.
```

## mac-address timer

### Syntax

```
mac-address timer aging age  
mac-address timer no-aging  
no mac-address timer
```

### View

System view

### Parameters

**aging** *age*: specifies the aging time (in seconds) for dynamic MAC address entries. The *age* argument ranges from 10 to 1000000.

**no-aging**: specifies not-to-age dynamic MAC address entries.

### Description

Use **mac-address timer** command to set MAC address aging timer.

Use **no mac-address timer** command to restore to the default.

The default MAC address aging timer is 300 seconds.

The timer applies only to dynamic address entries, including both entries learned and configured.

Setting an appropriate MAC address aging timer is important for the switch to run efficiently.

- If the aging timer is set too short, the MAC address entries that are still valid may be removed due to aging. Upon receiving a packet destined for a MAC address that is already removed, the switch broadcasts the packet to all ports within the VLAN to which the packet belongs. This decreases the operating performance.
- If the aging timer is set too long, MAC address entries may still exist even if they turn into invalid. This causes the switch to be unable to update its MAC address table in time. In this case, the MAC address table cannot reflect the change of network devices in time.

**Examples**

```
XS# mac-address timer aging 500
Aging time of dynamic MAC address is 500 seconds.
```

### 3.16 Multicast Commands

The “Any view” in the below table refers to anyone of the following: System view, Ethernet port view, Port-based VLAN view, VLAN view, or dot1x view.

**Command list:**

| View               | Command  |
|--------------------|--|
| Any view           | <a href="#">show mac-address multicast [ count   static { all   count   mac-address vlan vlan-id } ]</a>   |
| System view        | <a href="#">mac-address multicast mac-address interface ethernet interface [ to ethernet interface ] vlan vlan-id</a><br><a href="#">no mac-address multicast { all   interface ethernet interface [ to ethernet interface ] vlan vlan-id   mac-address vlan vlan-id }</a> |
| Ethernet port view | <a href="#">mac-address multicast mac-address vlan vlan-id</a><br><a href="#">no mac-address multicast mac-address vlan vlan-id</a>  |

#### show mac-address multicast

**Syntax**

```
show mac-address multicast [ count | static { all | count | mac-address
vlan vlan-id } ]
```

**View**

Any view

**Parameters**

**mac-address:** displays the static multicast MAC entry information for the specified MAC address.

**vlan vlan-id:** displays the static multicast MAC entry information in the specified VLAN.

**count:** displays the number of static multicast MAC entries.

## Description

Use **show mac-address multicast** command to display the information of the multicast MAC address entry or entries manually configured on the switch.

## Examples

XS# **show mac-address multicast**  
show all of the multicast mac-address

```
Vlan ID          :1
MAC address      :01-00-5e-00-00-e1
Port Member     :Ethernet0/2, Ethernet0/4, Ethernet0/6, Ethernet0/8,

Vlan ID          :1
MAC address      :01-00-5e-00-00-e0
Port            :
Member          :Ethernet0/1, Ethernet0/2, Ethernet0/3, Ethernet0/4, Ethernet0/5,

Total Entries    : 2
```

## mac-address multicast

### Syntax

In System view:

**mac-address multicast** *mac-address* **interface ethernet** *interface* [ **to ethernet** *interface* ] **vlan** *vlan-id*

**no mac-address multicast** { **all** | **interface ethernet** *interface* [ **to ethernet** *interface* ] **vlan** *vlan-id* | **mac-address** **vlan** *vlan-id* }

In Ethernet port view:

**mac-address multicast** *mac-address* **vlan** *vlan-id*

**no mac-address multicast** *mac-address* **vlan** *vlan-id*

### View

System view, Ethernet port view

### Parameters

*mac-address*: multicast MAC address, in the form of H-H-H-H-H-H.

**vlan** *vlan-id*: specifies the VLAN to which the forwarding ports belong. The effective range for *vlan-id* is from 1 to 4094.

*interface* : ethernet port, in the form of *interface* = { *interface-type/interface-number* }, *interface-type* = { 0 | 1 }, when *interface-type* is 0, *interface-number* = { 1 | 2 | ... | 24 }, when *interface-type* is 1, *interface-number* = { 1 | 2 }.

### Description

Use **mac-address multicast interface** command to create a multicast MAC address entry.

Use **no mac-address multicast interface** command to remove the specified multicast MAC address entry or all multicast MAC address entries.

Use **mac-address multicast vlan** command to create a multicast MAC address

entry on the port.

Use **no mac-address multicast vlan** command to remove the specified multicast MAC address entry or all multicast MAC address entries on the port.

Each multicast MAC address entry contains multicast address, forward port, VLAN ID, and so on.

### Examples

```
XS# mac-address multicast 01-00-5e-00-00-e8 interface ethernet 0/7 to ethernet 0/8 vlan 2
```

The configuration succeeds.

```
XS(Ethernet0/8)# no mac-address multicast 01-00-5e-00-00-e8 vlan 2
```

Delete successfully.

## 3.17 IGMP Snooping Configuration Commands

The “Any view” in the below table refers to anyone of the following: System view, Ethernet port view, Port-based VLAN view, VLAN view, or dot1x view.

### Command list:

| View        | Command   |
|-------------|---|
| Any view    | <a href="#">show igmp-snooping configuration</a>  |
| Any view    | <a href="#">show igmp-snooping group [ vlan <i>vlan-id</i> ]</a>  |
| System view | <a href="#">igmp-snooping</a>   |
| VLAN view   | <a href="#">no igmp-snooping</a>  |
| System view | <a href="#">igmp-snooping querier</a><br><a href="#">no igmp-snooping querier</a>   |
| System view | <a href="#">igmp-snooping query-interval [time <i>seconds</i>]</a><br><a href="#">no igmp-snooping query-interval</a>   |
| System view | <a href="#">igmp-snooping host-aging-time <i>seconds</i></a><br><a href="#">no igmp-snooping host-aging-time</a>  |
| System view | <a href="#">igmp-snooping router-aging-time <i>seconds</i></a><br><a href="#">no igmp-snooping router-aging-time</a>  |
| System view | <a href="#">igmp-snooping leave-time <i>seconds</i></a><br><a href="#">no igmp-snooping leave-time</a>  |
| System view | <a href="#">igmp-snooping max-response-time <i>seconds</i></a><br><a href="#">no igmp-snooping max-response-time</a>  |
| VLAN view   | <a href="#">multicast <i>static-router-port</i> ethernet <i>interface-number</i></a><br><a href="#">no multicast <i>static-router-port</i> ethernet <i>interface-number</i></a> |

### show igmp-snooping configuration

#### Syntax

```
show igmp-snooping configuration
```

#### View

Any view.

#### Parameters

None.

### Description

Use **show igmp-snooping configuration** command to display IGMP Snooping configuration information.

If IGMP Snooping is disabled, this command displays a message showing that IGMP Snooping is not enabled.

With IGMP Snooping enabled, this command displays the following information:

- IGMP Snooping status
- aging time of the host port
- aging time of the router port
- IGMP querying
- querying transmit timer
- max response timer
- leave timer

### Examples

```
XS# show igmp-snooping configuration
show igmp-snooping configuration
```

```
XS# show igmp-snooping configuration
show igmp-snooping configuration
```

```
Igmp-snooping global state      :Disabled
Host Timeout                    :260
Route Timeout                   :105
IGMP Querier                    :Disabled
Query Transmit Interval        :125
Max Response Time              :10
Last Member Query Interval     :1
```

## show igmp-snooping group

### Syntax

```
show igmp-snooping group [ vlan vlan-id ]
```

### View

Any view.

### Parameters

**vlan *vlan-id***: specifies the VLAN in which the multicast group information is to be displayed, where *vlan-id* ranges from 1 to 4094. If you do not specify a VLAN, this command displays the multicast group information of all VLANs.

### Description

Use **show igmp-snooping group** command to display the IGMP Snooping multicast group information.

### Examples

```
#display the information about the multicast groups of all VLANs.
XS# show igmp-snooping group
```

```
show igmp-snooping group information
```

```
Vlan ID           :1
Multicast group   :239.0.0.10
MAC address       :01-00-5e-00-00-0a
Port Member       :Ethernet0/4,
```

```
Total Entries    : 1
```

## igmp-snooping

### Syntax

```
igmp-snooping
no igmp-snooping
```

### View

System view, VLAN view.

### Parameters

None.

### Description

Use **igmp-snooping** command to enable the IGMP Snooping feature.  
Use **no igmp-snooping** command to disable the IGMP Snooping feature.  
By default, the IGMP Snooping feature is disabled.

### Examples

```
XS(vlan3)# igmp-snooping
Igmp-snooping is enabled on vlan 3.
```

## igmp-snooping querier

### Syntax

```
igmp-snooping querier
no igmp-snooping querier
```

### View

System view

### Parameters

None.

### Description

Use **igmp-snooping querier** command to enable IGMP querier.  
Use **no igmp-snooping querier** command to disable IGMP querier.  
By default, igmp-snooping querier is disabled.

### Examples

```
XS# igmp-snooping querier
IGMP querier has been enabled.
XS# no igmp-snooping querier
IGMP querier has been disabled.
```

## igmp-snooping query-interval

### Syntax

```
igmp-snooping query-interval [time seconds]
no igmp-snooping query-interval
```

### View

System view

### Parameters

*seconds*: time of query transmit interval, in a range from 1 to 300, in seconds.

### Description

Use **igmp-snooping query-interval** command to set the igmp snooping query transmit interval.

Use **no igmp-snooping query-interval** command to make the query transmit interval restore to the default setting.

By default, the query transmit interval is configured as 125 seconds.

### Examples

```
XS# igmp-snooping query-interval 30
Query-interval of igmp-snooping has been set to 30 seconds
```

```
XS# no igmp-snooping query-interval
The query transmit interval has been restored to default 125 seconds.
```

## igmp-snooping host-aging-time

### Syntax

```
igmp-snooping host-aging-time seconds
no igmp-snooping host-aging-time
```

### View

System view.

### Parameters

*seconds*: aging time (in seconds) of multicast member ports, in a range from 200 to 1,000.

### Description

Use **igmp-snooping host-aging-time** command to configure the aging time of multicast member ports.

Use **no igmp-snooping host-aging-time** command to restore to the default

aging time.

By default, the aging time of multicast member ports is 260 seconds.

The aging time of multicast member ports determines the refresh frequency of multicast group members. In an environment where multicast group members change frequently, a relatively shorter aging time is required.

### Examples

```
XS# igmp-snooping host-aging-time 300  
Host-aging-time of igmp-snooping set to 300 seconds
```

### igmp-snooping router-aging-time

#### Syntax

```
igmp-snooping router-aging-time seconds  
no igmp-snooping router-aging-time
```

#### View

System view.

#### Parameters

*seconds*: aging time of router ports, in a range from 1 to 1,000, in seconds.

#### Description

Use **igmp-snooping router-aging-time** command to configure the aging time of router ports.

Use **no igmp-snooping router-aging-time** command to restore to the default aging time.

By default, the aging time of router ports is 105 seconds.

### Examples

```
XS# igmp-snooping router-aging-time 200  
Router-aging-time of igmp-snooping set to 200 seconds
```

## igmp-snooping leave-time

#### Syntax

```
igmp-snooping leave-time seconds  
no igmp-snooping leave-time
```

#### View

System view.

#### Parameters

*seconds*: IGMP leave timer, in a range from 1 to 300, in seconds.

#### Description

Use **igmp-snooping leave-time** command to configure the IGMP query interval, i.e. the interval at which the switch sends IGMP general queries.

Use **no igmp-snooping leave-time** command to restore to the default.

By default, the leave timer is 30 seconds.

### Examples

XS# **igmp-snooping leave-time 200**  
 Leave-time of igmp-snooping set to 200 seconds

## igmp-snooping max-response-time

### Syntax

**igmp-snooping max-response-time** *seconds*  
**no igmp-snooping max-response-time**

### View

System view.

### Parameters

*seconds*: maximum response time in IGMP general queries, in a range from 1 to 25, in seconds.

### Description

Use **igmp-snooping max-response-time** command to configure the maximum response time in IGMP general queries.

Use **no igmp-snooping max-response-time** command to restore to the default. By default, the maximum response time in IGMP general queries is 10 seconds.

An appropriate setting of the maximum response time in IGMP queries allows hosts to respond to queries quickly and thus the querier can learn the existence of multicast members quickly.

### Examples

XS# **igmp-snooping max-response-time 20**  
 Max\_response\_time of igmp-snooping set to 20 seconds

## multicast static-router-port

### Syntax

**multicast static-router-port ethernet** *interface-number*  
**no multicast static-router-port ethernet** *interface-number*

### View

VLAN view.

### Parameters

*interface-number* : ethernet port, in the form of interface = { *interface-type/interface-number* }, *interface-type* = { 0 | 1 }, when *interface-type* is 0, *interface-number* = { 1 | 2 | ... | 24 }, when *interface-type* is 1, *interface-number* = { 1 | 2 }.

### Description

Use **multicast static-router-port** command to configure the specified port in the VLAN as a static router port.

Use **no multicast static-router-port** command to remove the specified port from the VLAN as a static router port.

By default, a port is not a static router port.

**Examples**

```
XS(vlan2)# multicast static-router-port ethernet 0/3
Succeed.
```

### 3.18 802.1x Configuration Commands

The “Any view” in the below table refers to anyone of the following: System view, Ethernet port view, Port-based VLAN view, VLAN view, or dot1x view.

**Command list:**

| View               | Command  |
|--------------------|--|
| Any view           | <a href="#">show dot1x { status   interface [ ethernet interface ] }</a>   |
| System view        | <a href="#">dot1x</a>  |
| dot1x view         | <a href="#">end</a>  |
| dot1x view         | <a href="#">max-req</a>  |
| dot1x view         | <a href="#">timeout { quiet-period quiet-period-value   reauth-period reauth-period-value   server server-timeout-value   supplicant supp-timeout-value   tx-period tx-period-value }</a>    |
| dot1x view         | <a href="#">no timeout { quiet-period quiet-period-value   reauth-period reauth-period-value   server server-timeout-value   supplicant supp-timeout-value   tx-period tx-period-value }</a> |
| dot1x view         | <a href="#">system-auth-control</a><br><a href="#">no system-auth-control</a>  |
| dot1x view         | <a href="#">radius-server host host-ip-address auth-port auth-port-number [ acct-port acct-port-number ] key key-string</a>  |
| Ethernet port view | <a href="#">dot1x</a><br><a href="#">no dot1x</a>  |
| Ethernet port view | <a href="#">dot1x re-authentication</a><br><a href="#">no dot1x re-authentication</a>  |
| Ethernet port view | <a href="#">dot1x port-control { auto   forceauthorized   forceunauthorized }</a>  |

#### **show dot1x**

**Syntax**

```
show dot1x { status | interface [ ethernet interface ] }
```

**View**

Any view.

**Parameters**

**status:** displays the information of 802.1x.  
**interface:** displays the 802.1x-related information of all ports.  
**ethernet interface:** displays the 802.1x-related information of a specified port.  
*interface* : ethernet port, in the form of *interface* = { *interface-type/interface-number* }, *interface-type* = { 0 | 1 }, when *interface-type* is 0, *interface-number* = { 1 | 2 | ... | 24 }, when *interface-type* is 1, *interface-number* = { 1 | 2 }.

**Description**

Use **show dot1x** command to display 802.1x related information.

**Examples**

```
#display 802.1x-related information.
XS# dot1x
XS(dot1x)# system-auth-control
802.1x has been enabled
Configuration completed successfully.
```

```
XS(dot1x)# show dot1x status
802.1x is enabled
```

```
Radius authentication server configuration:
authentication IP address :192.168.0.234
authentication port      :1812
authentication key       :admin
```

```
Radius accounting server configuration:
accounting IP address    :192.168.0.234
accounting port          :1813
accounting key           :admin
```

```
misc configuration:
quiet period             :60
server timeout           :30
supplicant timeout      :30
tx period                :30
reauth max count        :2
reauth period            :3600
```

# display the 802.1x-related information of all ports

XS# **show dot1x interface**

| PORT         | 802.1X ADMIN | PORTCONTROL     | REAUTH   | STATUS     |

## dot1x

### Syntax

**dot1x**

### View

System view.

### Parameters

None.

### Description

Enter into 802.1x configuration environment.

### Examples

```
XS# dot1x
XS(dot1x)#
```

## end

### Syntax

**end**

### View

dot1x view

### Parameters

None.

### Description

Exit from 802.1x configuration environment.

### Examples

```
XS(dot1x)# end
XS#
```

## max-req

### Syntax

```
max-req max-retry-value
```

### View

```
dot1x view
```

### Parameters

*max-retry-value*: Maximum number of times that a switch sends authentication request packets to a user. This argument ranges from 1 to 10.

### Description

By default, a switch sends authentication request packets to a user for up to 2 times.

After a switch sends an authentication request packet to a user, it will send another authentication request packet if it has not received response from the user after a specific period of time. If the switch still receives no response when the configured maximum number of authentication request transmission attempts is reached, it stops sending requests to the user. This command applies to all ports.

### Examples

```
XS(dot1x)# max-req 5
Max request count is 5.
```

## timeout

### Syntax

```
timeout { quiet-period quiet-period-value | reauth-period
reauth-period-value | server server-timeout-value | supplicant
supp-timeout-value | tx-period tx-period-value }
no timeout { quiet-period quiet-period-value | reauth-period
reauth-period-value | server server-timeout-value | supplicant
supp-timeout-value | tx-period tx-period-value }
```

### View

```
dot1x view
```

### Parameters

**quiet-period** *quiet-period-value*: sets the quiet-period timer. This timer sets the quiet-period. When a supplicant system fails to pass the authentication, the switch quiets for the set period (set by the quiet-period timer) before it processes another authentication request re-initiated by the supplicant system. During this quiet period, the switch does not perform any 802.1x authentication-related actions for the supplicant system.

The *quiet-period-value* argument ranges from 1 to 65535 (in seconds). By default,

the quiet-period timer is set to 60 seconds.

**reauth-period** *reauth-period-value*: specifies re-authentication interval, in seconds. After this timer expires, the switch initiates 802.1x re-authentication. The value of the *reauth-period-value* argument ranges from 60 to 7200. By default, the reauth-period timer is set to 3600 seconds.

**server** *server-timeout-value*: sets the RADIUS server timer. This timer sets the server-timeout period. After sending an authentication request packet to the RADIUS server, a switch will send another authentication request packet if it has not received the response from the RADIUS server when this timer times out. The *server-timeout-value* argument ranges from 1 to 300 (in seconds). By default, the RADIUS server timer is set to 30 seconds.

**supplicant** *supp-timeout-value*: sets the supplicant system timer. This timer sets the supp-timeout period and is triggered by the switch after the switch sends a request/challenge packet to a supplicant system (The packet is used to request the supplicant system for the MD5 encrypted string). The switch will send another request/challenge packet to the supplicant system if the switch does not receive the response from the supplicant system when this timer times out.

The *supp-timeout-value* argument ranges from 1 to 300 (in seconds). By default, the supplicant system timer is set to 30 seconds.

**tx-period** *tx-period-value*: sets the transmission timer. This timer sets the tx-period and is triggered in two cases. The first case is when the client requests for an authentication. The switch sends a unicast request/identity packet to a supplicant system and then triggers the transmission timer. The switch will send another request/identity packet to the supplicant system if it has not received the reply packet from the supplicant system when this timer times out. The second case is when the switch authenticates the 802.1x client who cannot request for authentication actively. The switch sends multicast request/identity packets periodically through the port with 802.1x function enabled. In this case, this timer sets the interval of sending the multicast request/identity packets.

The *tx-period-value* argument ranges from 1 to 65535 (in seconds). By default, the transmission timer is set to 30 seconds.

### Description

Use **timeout** command to set a specified 802.1x timer.

Use **no timeout** command to restore a specified 802.1x timer to the default setting.

### Examples

```
XS(dot1x)# timeout quiet-period 120  
Timeout of the quiet period is 120 seconds.
```

## system-auth-control

### Syntax

```
system-auth-control  
no system-auth-control
```

### View

```
dot1x view
```

### Parameters

None.

### Description

Use **system-auth-control** command to enable 802.1x globally.  
Use **no system-auth-control** command to disable 802.1x globally.

### Examples

```
XS(dot1x)# system-auth-control  
802.1x is enabled  
The configuration succeeds.
```

## radius-server

### Syntax

```
radius-server host host-ip-address auth-port auth-port-number [ acct-port  
acct-port-number ] key key-string
```

### View

dot1x view

### Parameters

**host** *host-ip-address*: IP address of the radius server to be used, a valid unicast address in dotted decimal notation, the default value is 192.168.0.234.

**auth-port** *auth-port-number*: UDP port number of the radius server, ranging from 1 to 65535, the default value is 1812.

**acct-port** *acct-port-number*: UDP port number of the radius server, ranging from 1 to 65535, the default value is 1813.

**key** *key-string*: sets a shared key for radius messages. String length is from 1 to 15 characters.

### Description

Use radius-server command to set radius server related configurations.

### Examples

```
XS(dot1x)# radius-server host 192.168.0.222 auth-port 1855 acct-port 1856  
key admin  
The configuration succeeds.
```

## dot1x

### Syntax

```
dot1x  
no dot1x
```

### View

Ethernet port view

### Parameters

None.

### Description

Use **dot1x** command to enable 802.1x for the specified Ethernet port.  
Use **no dot1x** command to disable 802.1x for the specified Ethernet port.

### Examples

```
XS(Ethernet0/1)# dot1x
802.1x is enabled on port ethernet0/1
```

## dot1x re-authentication

### Syntax

```
dot1x re-authentication
no dot1x re-authentication
```

### View

Ethernet port view

### Parameters

None.

### Description

Use **dot1x re-authentication** command to enable 802.1x re-authentication for the specified Ethernet port.  
Use **no dot1x** command to disable 802.1x re-authentication for the specified Ethernet port.

### Examples

```
XS(Ethernet0/1)# dot1x re-authentication
The configuration succeeds.
```

## dot1x port-control

### Syntax

```
dot1x port-control { auto | forceauthorized | forceunauthorized }
```

### View

Ethernet port view

### Parameters

**auto**: specified to operate in **auto** access control mode. When a port operates in this mode, all the unauthenticated hosts connected to it are unauthorized. In this case, only EAPoL packets can be exchanged between the switch and the hosts. After passing the authentication, the hosts connected to the port are authorized to access the network resources. Normally, a port operates in this mode.

**forceauthorized**: specified to operate in **forceauthorized** access control mode. When a port operates in this mode, all the hosts connected to it can access the

network resources without the need of authentication.

**forceunauthorized**: specified to operate in **forceunauthorized** access control mode. When a port operates in this mode, the hosts connected to it cannot access the network resources.

### Description

Use **dot1x port-control** command to specify the access control mode for the specified Ethernet port.

### Examples

```
XS(Ethernet0/1)# dot1x port-control auto
The configuration succeeds.
```

## 3.19 STP Commands

The “Any view” in the below table refers to anyone of the following: System view, Ethernet port view, Port-based VLAN view, VLAN view, or dot1x view.

### Command list:

| View                              | Command  |

## show spanning-tree

### Syntax

```
show spanning-tree [ ethernet interface ]
```

### View

Any view.

### Parameters

*interface* : ethernet port, in the form of interface = { interface-type/interface-number}, interface-type = {0 | 1}, when interface-type is 0, interface-number = { 1 | 2 | ... | 24 }, when interface-type is 1, interface-number = { 1 | 2}.

### Description

Use **show spanning-tree** command to display the settings of STP. If an Ethernet interface is specified, the STP information of this interface will be displayed.

### Examples

```
#display the STP information of all ports
XS(Ethernet0/1)# show spanning-tree
```

The spanning tree is enabled on this switch!

The spanning tree mode is RSTP!

```
Bridge Priority: 32768
Hello time: 2
Max age time: 20
Forward delay time: 15
```

```
Bridge ID: 32768:28-b0-cc-00-31-d4
Root ID: 32768:28-b0-cc-00-31-d4
```

```
Interfaces
  Port      StpState  Priority  PathCost  PortRole  PortState  Designed
-----
Ethernet0/1  Enabled   0         0         Auto      Disabled   Disabled
0:0
```

| Ethernet0/24<br>23:128 | Enabled | 128 | Auto | Designated | Disabled   |
| Ethernet1/1<br>24:128  | Enabled | 128 | Auto | Designated | Disabled   |
| Ethernet1/2<br>25:128  | Enabled | 128 | Auto | Designated | Disabled   |

#display the STP information of ethernet 0/1 interface  
 XS(Ethernet0/1)# **show spanning-tree ethernet 0/1**

Port: Ethernet0/1  
 STP admin: enabled  
 Edge Port: Disabled  
 Point to point: auto  
 Protocol migration: Disabled  
 TX hold count: 3

```
LBD: Disabled
Path cost: 20000
Port priority: 128
STP State: Disabled
STP Role: Disabled
Designated Port id: 0-0
Designated Path Cost: 0
Designated Bridge id: 0:00-00-00-00-00-00
```

## show spanning-tree

### Syntax

```
show spanning-tree {ethernet Ethernet-port instance mstid |
mst-configuration | instance mstid}
```

### View

Any view.

### Parameters

*Ethernet-port* : *ethernet port, in the form of interface = { interface-type/interface-number}, interface-type = {0 | 1}, when interface-type is 0, interface-number = { 1 | 2 | ... | 24 }, when interface-type is 1, interface-number = { 1 | 2 }.*

**mst-configuration**: MST Configuration Identification.

**instance** *mstid* : MSTP instance ID, in the range from 0 to 15.

### Description

Use **show spanning-tree** command to display the settings of MSTP. If an Ethernet interface and an instance are specified, the MSTP information of this interface in the specified instance will be displayed.

Note: This command is only used in MSTP spanning tree mode.

### Examples

```
XS# show spanning-tree
```

The spanning tree is enabled on this switch!

The spanning tree mode is MSTP!

```
Bridge Priority: 32768
Max hops: 20
Hello time: 2
Max age time: 20
Forward delay time: 15
```

```
MSTI 0 VLANs map: 1-4094
MST Region Name: 28:B0:CC:01:01:64
MST Revision Level: 0
```

```
Bridge ID: 32768:28-b0-cc-00-31-d4
Root ID: 32768:28-b0-cc-00-31-d4   Root PortId: 0-0
```

### Interfaces

| Port  | Priority | PathCost | PortRole | PortState | D.BridgeID | D.PortID |
|-------|----------|----------|----------|-----------|------------|----------|
| ----- |          |          |          |           |            |          |

|             |     |   |            |            |                    |       |
|-------------|-----|---|------------|------------|--------------------|-------|
| Ethernet0/1 | 128 | 0 | Disabled   | Disabled   | 32768:28b0cc0031d4 | 128:1 |
| Ethernet0/2 | 128 | 0 | Disabled   | Disabled   | 32768:28b0cc0031d4 | 128:2 |

## spanning-tree

### Syntax

**spanning-tree**  
**no spanning-tree**

### View

System view, Ethernet port view

#### Parameters

None.

#### Description

Use **spanning-tree** command to enable STP globally (in System view) or for a port (in Ethernet port view).

Use **no spanning-tree** command to disable STP globally (in System view) or for a port (in Ethernet port view).

By default, STP is disabled both globally and on ports.

#### Examples

```
XS(Ethernet0/1)# spanning-tree  
Enable ethernet0/1 spanning tree successfully.
```

## spanning-tree forward-time

#### Syntax

```
spanning-tree forward-time timer-value  
no spanning-tree forward-time
```

#### View

System view

#### Parameters

*timer-value*: forward delay in seconds to be set. This argument ranges from 4 to 30. The default value is 15 seconds.

#### Description

Use **spanning-tree forward-time** command to set the forward delay of the switch.

Use **no spanning-tree forward-time** command to restore the forward delay to the default value.

By default, the forward delay of the switch is 15 seconds.

To prevent the occurrence of temporary loops, when a port changes its state from discarding to forwarding, it undergoes an intermediate state and waits for a specific period of time to synchronize with the state transition of the remote switches. This state transition period is determined by the forward delay configured on the root bridge.

The forward delay setting configured on a root bridge applies to all non-root bridges. As for the configuration of the three time-related parameters (hello time, forward delay, and max age), the following formulas must be met to prevent network jitter.

- $2 \times (\text{forward delay} - 1 \text{ second}) \geq \text{max age}$
- $\text{Max age} \geq 2 \times (\text{hello time} + 1 \text{ second})$

#### Examples

XS# **spanning-tree forward-time 17**  
Configure successfully

## spanning-tree hello-time

### Syntax

**spanning-tree hello-time** *timer-value*  
**no spanning-tree hello-time**

### View

System view

### Parameters

*timer-value*: hello time in seconds to be set. This argument ranges from 1 to 10. The default value is 2 seconds.

### Description

Use **spanning-tree hello-time** command to set the hello time.  
Use **no spanning-tree hello-time** command to restore the hello time to the default value.  
By default, the hello time is 2 seconds.

A root bridge regularly sends out configuration BPDUs to maintain the stability of existing spanning trees. If the switch does not receive a BPDU packet in a specified period, spanning trees will be recalculated when BPDU packet times out. When a switch becomes a root bridge, it regularly sends BPDUs at the interval specified by the hello time you have configured on it. The other non-root-bridge switches adopt the interval specified by the hello time.

As for the configuration of the three time-related parameters (hello time, forward delay, and max age), the following formula must be met to prevent network jitter.

- $2 \times (\text{forward delay} - 1 \text{ second}) \geq \text{max age}$
- $\text{Max age} \geq 2 \times (\text{hello time} + 1 \text{ second})$

### Examples

XS# **spanning-tree hello-time 3**  
Configure successfully.

## spanning-tree max-age

### Syntax

**spanning-tree max-age** *timer-value*  
**no spanning-tree max-age**

### View

System view

### Parameters

*timer-value*: max age to be set, in a range from 6 to 40 (seconds). The default value is 20 seconds.

### Description

Use **spanning-tree max-age** command to set the max age.  
Use **no spanning-tree max-age** command to restore to the default max age.

By default, the max age of a switch is 20 seconds.  
To set the three time-related parameters (hello time, forward delay, and max age), the following formulas must be met to prevent network jitter.

- $2 \times (\text{forward delay} - 1 \text{ second}) \geq \text{max age}$
- $\text{Max age} \geq 2 \times (\text{hello time} + 1 \text{ second})$

### Examples

```
XS# spanning-tree max-age 25  
Configure successfully.
```

## spanning-tree priority

### Syntax

```
spanning-tree priority priority  
no spanning-tree priority
```

### View

System view

### Parameters

*priority*: switch priority to be set. This argument ranges from 0 to 65535. The default value is 32768.

### Description

Use **spanning-tree priority** command to set the priority.  
Use **no spanning-tree priority** command to restore the priority to default priority.  
The default priority is 32768.  
The priorities of switches are used for spanning tree calculation.

### Examples

```
XS# spanning-tree priority 35000  
Configure stp successfully!
```

## spanning-tree max-hops

### Syntax

```
spanning-tree max-hops hops  
no spanning-tree max-hops
```

### View

System view

### Parameters

*hops*: switch priority to be set. This argument ranges from 0 to 65535. The default value is 32768.

### Description

Use **spanning-tree max-hops** command to set the MSTP max-hops.  
Use **no spanning-tree max-hops** command to restore the max-hops to default value.  
The default max-hops are 20.

### Examples

```
XS# spanning-tree max-hops 18  
Configure successfully
```

## spanning-tree mode

### Syntax

```
spanning-tree mode {stp | rstp | mstp}
```

### View

System view

### Parameters

**stp**: specifies the STP mode.  
**rstp**: specifies the RSTP mode.  
**mstp**: specifies the MSTP mode

### Description

Use **stp mode** command to set the operating mode of the switch.  
To make the switch compatible with STP/RSTP/MSTP, the following three operating modes are provided.

**stp**: in this mode, the ports of the switch send STP BPDUs to neighbor devices.  
In the case that there is a neighbor switch working in RSTP or MSTP mode, the port between them will work in STP mode.

**rstp**: in this mode, the ports of a switch send RSTP BPDUs to neighbor devices.  
**mstp**: in this mode, the ports of a switch send MSTP BPDUs to neighbor devices.

### Examples

```
XS# spanning-tree mode stp  
Set successfully
```

## spanning-tree bpdu-guard

### Syntax

```
spanning-tree bpdu-guard  
no spanning-tree bpdu-guard
```

### View

System view

### Parameters

None.

### Description

Use **spanning-tree bpdu-guard** command to enable the bpdu-guard.  
Use **no spanning-tree bpdu-guard** command to disable the bpdu-guard.

### Examples

```
XS# spanning-tree bpdu-guard
Set successfully
```

## spanning-tree hold-count

### Syntax

```
spanning-tree hold-count num
no spanning-tree hold-count
```

### View

System view

### Parameters

**hold-count** *num*: ranges from 1 to 10.

### Description

Use **spanning-tree hold-count** command to set the hold-count for a specified Ethernet port.  
Use **no spanning-tree hold-count** command to restore to the default value 3 for a specified Ethernet port.

### Examples

```
XS(Ethernet0/1)# spanning-tree hold-count 5
Set successfully
```

## spanning-tree root-guard

### Syntax

```
spanning-tree root-guard
no spanning-tree root-guard
```

### View

Ethernet port view

### Parameters

None.

### Description

Use **spanning-tree root-guard** command to enable the root protection function for a specified port on the switch.

Use **no spanning-tree root-guard** command to disable the root protection for a specified port on the switch.

#### Examples

```
XS(Ethernet0/1)# spanning-tree root-guard  
Set successfully
```

## spanning-tree path-cost

#### Syntax

```
spanning-tree path-cost cost  
no spanning-tree path-cost
```

#### View

Ethernet port view

#### Parameters

*cost*: path cost to be set for the port. The range of the *cost* argument varies with the standard used for calculating the default path cost of a port as follows:

With IEEE 802.1D-1998 standard selected, the path cost of an Ethernet port ranges from 1 to 65535.

With IEEE 802.1t standard selected, the path cost of an Ethernet port ranges from 1 to 200000000.

The argument ranges from 1 to 200000000, and the default value is auto ( 0 ) .

#### Description

Use **spanning-tree path-cost** command to set the path cost(s) of the specified port(s).

Use **no spanning-tree path-cost** command to restore to the default value of the path cost(s) of the specified port(s).

#### Examples

```
XS(Ethernet0/1)# spanning-tree path-cost 300  
Set successfully
```

## spanning-tree priority

#### Syntax

```
spanning-tree priority priority  
no spanning-tree priority
```

#### View

Ethernet port view

#### Parameters

*priority*: port priority to be set. This argument ranges from 0 to 255, and the default value is 128.

### Description

Use **spanning-tree priority** command to set a port priority for the specified ports.  
Use **no spanning-tree priority** command to restore to the default priority of the specified ports.

### Examples

```
XS(Ethernet0/1)# spanning-tree priority 200  
Set successfully
```

## spanning-tree point-to-point

### Syntax

```
spanning-tree point-to-point  
no spanning-tree point-to-point
```

### View

Ethernet port view

### Parameters

None.

### Description

Use **spanning-tree point-to-point** command to specify that the links connected to the specified Ethernet ports be point-to-point.

Use **no spanning-tree point-to-point** command to specify that the links connected to the specified Ethernet ports be not point-to-point.

By default, the Ethernet ports are point-to-point links.

The rapid transition feature is not applicable to ports connected to non-point-to-point links.

If an Ethernet port is the master port among aggregated ports or operates in full-duplex mode, the link connected to the port is a point-to-point link.

### Examples

```
XS(Ethernet0/1)# no spanning-tree point-to-point  
Set default value false
```

## spanning-tree protocol-migration

### Syntax

```
spanning-tree protocol-migration  
no spanning-tree protocol-migration
```

### View

Ethernet port view

### Parameters

None.

### Description

Use **spanning-tree protocol-migration** command to enable the protocol migration feature.

Use **no spanning-tree protocol-migration** command to disable the protocol migration feature.

By default, the protocol migration feature is enabled.

### Examples

```
XS(Ethernet0/1)# no spanning-tree protocol-migration  
Set default value false
```

## spanning-tree edge

### Syntax

```
spanning-tree edge  
no spanning-tree edge
```

### View

Ethernet port view

### Parameters

None.

### Description

Use **spanning-tree edge** command to configure the specified Ethernet ports as edge ports.

Use **no spanning-tree edge** command to configure the specified Ethernet ports as non-edge ports.

By default, all Ethernet ports of a switch are non-edge ports.

An edge port is directly connected to a user terminal instead of through another switch or a network segment. Rapid transition to the forwarding state is applied to edge ports because no loops can be incurred by network topology changes on these ports. You can enable a port to turn to the forwarding state rapidly by setting it to an edge port. And it is recommended to configure the Ethernet ports directly connected to user terminals as edge ports.

Normally, configuration BPDUs cannot reach an edge port because the port is not connected to another switch. But when the BPDU guard function is disabled on an edge port, configuration BPDUs sent deliberately by a malicious user may reach the port. If an edge port receives a BPDU, it turns into a non-edge port.

### Examples

```
XS(Ethernet0/1)# spanning-tree edge  
Set successfully
```

## spanning-tree mst-configuration

### Syntax

```
spanning-tree mst-configuration
```

### View

System view.

### Parameters

None.

### Description

Use **spanning-tree mst-configuration** command to enter mst-region configuration environment.

### Examples

```
XS# spanning-tree mst-region
XS(mst-region)#
```

## instance

### Syntax

```
instance msti
no Instance msti
```

### View

Mst-region view

### Parameters

*msti*: MST instance ID

### Description

Use **instance** command to enable the specified MST instance.  
Use **no instance** command to disable the specified MST instance.  
By default, the all instances except 0-feature are disabled.

### Examples

```
XS(mst-region)# instance 3
Enable this msti successfully
```

## instance *msti* ethernet *ethernet-port* path-cost

### Syntax

```
instance msti ethernet ethernet-port path-cost cost
no instance msti ethernet ethernet-port path-cost cost
```

### View

Mst-region view

### Parameters

*Msti*: MST instance ID

*ethernet-port*: ethernet port, in the form of interface = { interface-type/interface-number}, interface-type = {0 | 1}, when interface-type is 0, interface-number = { 1 | 2 | ... | 24 }, when interface-type is 1, interface-number = { 1 | 2 }

*cost*: path to be set. This argument ranges from 0 to 200000000, and the default value is auto (0)

### Description

Use **instance msti ethernet ethernet-port path-cost** command to set the path cost for an Ethernet port in specific MST instance.

Use **no instance msti ethernet ethernet-port path-cost** command to restore to the default value for the Ethernet port in specific MST instance.

By default, the path cost value is auto (0).

### Examples

```
XS(mst-region)# instance 3 ethernet 0/3 path-cost 20000
Set successfully
```

## instance msti ethernet ethernet-port priority

### Syntax

**instance msti ethernet ethernet-port priority pri**  
**no instance msti ethernet ethernet-port priority pri**

### View

Mst-region view

### Parameters

*Msti*:instance ID

*ethernet-port*: ethernet port, in the form of interface = { interface-type/interface-number}, interface-type = {0 | 1}, when interface-type is 0, interface-number = { 1 | 2 | ... | 24 }, when interface-type is 1, interface-number = { 1 | 2 }

*pri*: port priority to be set. This argument ranges from 0 to 255, and the default value is 128

### Description

Use **instance msti ethernet ethernet-port priority** command to set the priority for an Ethernet port in the specified MST instance.

Use **no instance msti ethernet ethernet-port priority** command to restore to the default value for the Ethernet port in the specified MST instance.

By default, all instances except 0-feature are disabled.

### Examples

```
XS(mst-region)# instance 3 ethernet 0/3 priority 120
Set successfully
```

## instance msti priority

### Syntax

**instance** *msti* **priority** *pri*  
**no instance** *msti* **priority** *pri*

#### View

Mst-region view

#### Parameters

*Msti*: instance ID

*Pri*: the priority for the specified instance. It is in the range of 0 to 65535, the default value is 32768.

#### Description

Use **instance** *msti* **priority** command to set the priority for an instance.

Use **no instance** command to restore to the default value 32768 for the instance.

#### Examples

```
XS(mst-region)# instance 3 priority 4096
Set successfully
```

## **instance** *msti* **vlan**

#### Syntax

**instance** *msti* **vlan** *vlan-vid* [**to** *vlan-end-vid*]  
**no instance** *msti* **vlan** *vlan-vid* [**to** *vlan-end-vid*]

#### View

Mst-region view

#### Parameters

*Msti*: instance ID

*vlan-vid*: specifies the ID of a VLAN to be added to this instance, in the range of 1 to 4094.

*to vlan-end-vid*: in conjunction with *vlan-vid*, defines a VLAN range to be added to this instance. The *vlan-end-vid* argument takes a value in the range of 1 to 4094, and must not be less than that of *vlan-vid*.

#### Description

Use **instance** *msti* **vlan** command to set a vlan mapping for the specified MST instance.

Use **no instance** *msti* **vlan** command to remove a VLAN(s) from the specified MST instance.

#### Examples

```
XS(mst-region)# instance 3 vlan 4 to 6
Set successfully
```

## region-name

### Syntax

**region-name** *name*

### View

Mst-region view

### Parameters

*name*: a variable length text string encoded within a fixed field of 32 octets

### Description

Use **region-name** command to set the configuration name of MST Configuration Identification.

### Examples

```
XS(mst-region)# region-name example
configure mstp region name successfully!
```

## revision-level

### Syntax

**revision-level** *level*

### View

Mst-region view

### Parameters

*level*: an unsigned short value, in the range from 0 to 65535

### Description

Use **revision-level** command to set the revision level of MST Configuration Identification.

### Examples

```
XS(mst-region)# revision-level 25
configure mstp region level successfully!
```

## 3.20 SNMP Configuration Commands

The "Any view" in the below table refers to anyone of the following: System view, Ethernet port view, Port-based VLAN view, VLAN view, or dot1x view.

### Command list:

| View     | Command                   |
|----------|---------------------------|
| Any view | <a href="#">show snmp</a> |

|                    |   |
|--------------------|---|
| Any view           | <a href="#">show snmp community</a>   |
| Any view           | <a href="#">show snmp user</a>  |
| Any view           | <a href="#">show snmp traps-host</a>  |
| Any view           | <a href="#">show snmp traps-status</a>  |
| System view        | <a href="#">snmp-server { name   description   contact   location } text</a>                        |
| System view        | <a href="#">snmp-server community</a><br><a href="#">no snmp-server community community-name</a>    |
| System view        | <a href="#">snmp-server user</a><br><a href="#">no snmp-server user username</a>                    |
| System view        | <a href="#">snmp-server traps</a><br><a href="#">no snmp-server traps</a>                           |
| System view        | <a href="#">snmp-server traps-host host-ip</a><br><a href="#">no snmp-server traps-host host-ip</a> |
| Ethernet port view | <a href="#">snmp-traps</a><br><a href="#">no snmp-traps</a>   |

## show snmp

### Syntax

**show snmp**

### View

Any view.

### Parameters

None.

### Description

Use **show snmp** command to display the system SNMP information, including system name, system description, contact information, and geographical location. By default, the system name is "XS7424", the system description is "Optical Ethernet Switch", the contact information is [support@xenya.si](mailto:support@xenya.si), and the geographical location is "Ljubljana, Slovenia".

### Examples

```
XS(Ethernet0/23)# show snmp

SNMP System Name       : XS7424
SNMP System Description: Optical Ethernet Switch
SNMP System Contact    : support@xenya.si
SNMP System Location   : Ljubljana, Slovenia
```

## show snmp community

### Syntax

**show snmp community**

### View

Any view.

### Parameters

None.

### Description

Use **show snmp community** command to display the information of SNMPv1/SNMPv2c communities.

SNMPv1 and SNMPv2c use community name authentication. Therefore, the SNMPv1 and SNMPv2c messages carry community names; if the carried community names are not permitted by the NMS/agent, the messages will be discarded.

You need to create a read community name and a write community name separately, and these two community names on the NMS and on the device should be consistent.

To display the current configuration username information of SNMPv3, use **show snmp user** command.

### Examples

```

XS# show snmp community
-----
Version      Community    Popedom
-----
v1           public       RO
v2c         com2         RW
    
```

## show snmp user

### Syntax

**show snmp user**

### View

Any view.

### Parameters

None.

### Description

Use **show snmp user** command to display the information of SNMPv3 users, including username, auth type, auth password, privacy type, and privacy password.

SNMPv3 introduces the concepts of username and group. You can set the authentication and privacy functions. The former is used to authenticate the validity of sending packets, preventing the access of illegal users; the latter is used to encrypt packets between the NMS and agent, preventing the packets from being intercepted. A more secure communication between SNMP NMS and SNMP agent can be ensured by configuring whether to perform authentication and encryption or not.

You can configure whether to perform authentication and encryption when you create a SNMPv3 group, and configure the specific algorithms and passwords for authentication and encryption when a user is created.

### Examples

```

XS# show snmp user
Ver User          AuthType: AuthPwd   PrivType: PrivPwd   Privilege
-----
v3 user1          :                   :                   RW
v3 user2          MD5:useruser2222   :                   RW
v3 user3          MD5:agewhrjykkll  DES:sageriutu6ui    RW
    
```

## show snmp traps-host

### Syntax

```
show snmp traps-host
```

### View

Any view.

### Parameters

None.

### Description

Use **show snmp traps-host** command to list destination hosts that receive SNMP traps generated by the local device.

### Examples

```

XS# show snmp traps-host
SNMP traps-host IP:
192.168.0.234
192.168.0.235
    
```

## show snmp traps-status

### Syntax

```
show snmp traps-status
```

### View

Any view.

### Parameters

None.

### Description

Use **show snmp traps-status** command to display global trap configurations and per port trap configurations.

### Examples

```

XS# show snmp traps-status
Global trap is enabled.
interface          status
-----
ethernet 0/1      enable
    
```

|                     |               |
|---------------------|---------------|
| ethernet 0/2        | enable        |
| ethernet 0/3        | enable        |
| ethernet 0/4        | enable        |
| <b>ethernet 0/5</b> | <b>enable</b> |
| ethernet 0/6        | enable        |
| ethernet 0/7        | enable        |
| ethernet 0/8        | enable        |
| ethernet 0/9        | enable        |
| ethernet 0/10       | enable        |
| ethernet 0/11       | enable        |
| ethernet 0/12       | enable        |
| ethernet 0/13       | enable        |
| ethernet 0/14       | enable        |
| ethernet 0/15       | enable        |
| ethernet 0/16       | enable        |
| ethernet 0/17       | enable        |
| ethernet 0/18       | enable        |
| ethernet 0/19       | enable        |
| ethernet 0/20       | enable        |
| ethernet 0/21       | enable        |
| ethernet 0/22       | enable        |
| ethernet 0/23       | disable       |
| ethernet 0/24       | enable        |
| ethernet 1/1        | enable        |
| ethernet 1/2        | enable        |

## snmp-server

### Syntax

**snmp-server** { **name** | **description** | **contact** | **location** } *text*

### View

System view.

### Parameters

*text*: a string of 1 to 256 characters

**name**: SNMP System Name, the default value is "XS7424"

**description**: SNMP System Description, the default value is "Optical Ethernet Switch"

**contact**: SNMP System Contact, the default value is [support@xenya.si](mailto:support@xenya.si)

**location**: SNMP System Location, the default value is "Ljubljana, Slovenia"

### Description

Use **snmp-server** command to set the system information, including system name, system description, contact information, and location.

### Examples

```
XS# snmp-server name dev-xs7424
Configure system name successfully!
```

## snmp-server community

## Syntax

```
snmp-server community  
no snmp-server community community-name
```

## View

System view.

## Parameters

*community-name*: name of the community to be created; it is a string of 3 to 16 characters.

## Description

Use **snmp-server community** command to create a SNMP community. SNMPv1 and SNMPv2c use a community name to restrict access rights. You can use this command to configure a community name and configure read or write access rights.

Use **no snmp-server community** command to remove an SNMP community. Typically, "public" is used as a read community name, and "private" is used as a write community name. For security reason, it is recommended to use a community name other than these two.

## Examples

```
XS# snmp-server community  
Version (v1 or v2c): v2c  
Community (3-16chars): com3  
Privilege (ro or rw): ro
```

Add snmp agent user successfully!

## snmp-server user

### Syntax

```
snmp-server user  
no snmp-server user username
```

### View

System view.

### Parameters

*username*: username, a string of 3 to 16 characters.

**Auth-Algorithm**: specifies the security mode for authentication. If this is not specified, neither authentication nor encryption is performed.

**MD5**: uses HMAC MD5 algorithm for authentication.

**SHA**: uses HMAC SHA algorithm for authentication, which is more secure than MD5.

*auth-password*: authentication password, a string of 9 to 15 characters in plain text, a 32-bit hexadecimal number in cipher text if MD5 algorithm is used, and a 40-bit hexadecimal number in cipher text if SHA algorithm is used.

**Priv-Algorithm**: specifies the security mode as encrypted.

**DES**: specifies the encryption protocol as Data Encryption Standard (DES).

**AES**: specifies the encryption protocol as Advanced Encryption Standard (AES),

which is more secure than DES.

*priv-password*: encryption password, a string of 1 to 64 characters in plain text, a 32-bit hexadecimal number in cipher text if MD5 algorithm is used, and a 40-bit hexadecimal number in cipher text if SHA algorithm is used.

### Description

Use **snmp-server user** command to add a user.

Use **no snmp-server user** command to remove a user.

This command is applicable to SNMPv3. If the agent and the NMS communicate using SNMPv3 messages, a SNMPv3 user needs to be created first. Whether to perform authentication or encryption can be configured at the creation of a user, the algorithm and password for authentication or encryption can be set as well.

### Examples

```
XS# snmp-server user  
UserName (3-16chars): user3  
Popedom (ro or rw): ro  
Auth-Algorithm (MD5 or SHA or NULL): SHA  
auth-password (9-15chars): galhgowegqqq  
Priv-Algorithm (DES or AES or NULL): NULL
```

Add snmp agent user successfully!

## snmp-server traps

### Syntax

```
snmp-server traps  
no snmp-server traps
```

### View

System view.

### Parameters

None.

### Description

Use **snmp-server traps** command to enable a device to send SNMP traps.

Use **no snmp-server traps** command to disable a device from sending SNMP traps.

By default, a device sends SNMP traps.

**snmp-server traps** command needs to be used together with **snmp-server traps-host** command. The **snmp-server traps-host** command specifies the destination hosts of SNMP traps. At least one destination host is required for SNMP traps.

### Examples

```
XS# snmp-server traps  
Enable global traps successfully!
```

## snmp-server traps-host

### Syntax

```
snmp-server traps-host host-ip  
no snmp-server traps-host host-ip
```

### View

System view.

### Parameters

*host-ip*: specifies the destination for the SNMP traps.

### Description

Use **snmp-server traps-host** command to set a destination host to receive the SNMP traps generated.

Use **no snmp-server traps-host** command to cancel the current setting. Multiple destination hosts can be set to receive traps.

### Examples

```
XS# snmp-server traps-host 192.168.0.111  
Add traps-host successfully!
```

## snmp-traps

### Syntax

```
snmp-traps  
no snmp-traps
```

### View

Ethernet port view

### Parameters

None.

### Description

Use **snmp-traps** command to enable the sending of port/interface linkUp/linkDown traps.

Use **no snmp-traps** command to disable the sending of linkUp/linkDown traps. By default, sending port/interface linkUp/linkDown traps is enabled.

Note that you need to enable the generation of port/interface linkUp/linkDown traps on both port/interface and global to make it effective. To enable this function on a port/interface, use **snmp-traps** command; to enable this function globally, use **snmp-server traps** command.

By default, both are enabled.

### Examples

XS(Ethernet0/23)# **snmp-traps**

Enable this interface snmp trap (sending linkUp or linkDown) successfully!

## 3.21 System Log Commands

The "Any view" in the below table refers to anyone of the following: System view, Ethernet port view, Port-based VLAN view, VLAN view, or dot1x view.

### command lists:

| View        | command                  |
|-------------|--------------------------|
| Any view    | <a href="#">show log</a> |
| System view | <a href="#">no log</a>   |

### show log

#### Syntax

**show log**

#### View

Any view.

#### Parameters

None

#### Description

Show all the system logs , including when the system was started, who had logged in the system and how, and so on.

#### Examples

```
XS# show log
2009/10/10 10:47:28 192.168.0.209 logins WEB-SERVER!
2009/10/10 10:46:43 Someone logins CLI with serial port, level 3!
2009/10/10 10:46:24 Starting system!
```

### no log

#### Syntax

**no log**

#### View

System view

#### Parameters

None

#### Description

Clear all the logs that were saved in the system.

### Examples

```
XS# no log
Clear all the logs successfully!
```

## 3.22 LLDP Configuration Commands

The "Any view" in the below table refers to anyone of the following: System view, Ethernet port view, Port-based VLAN view, VLAN view, or dot1x view.

### Command list:

| View               | command   |
|--------------------|---|
| System view        | <a href="#">lldp</a>  |
| Ethernet port view | <a href="#">no lldp</a>   |
| System view        | <a href="#">lldp admin-status { disable   rx   tx   rctx }</a>  |
| Ethernet port view | <a href="#">lldp encapsulation { snap   Ethernet-ii }</a>   |
| System view        | <a href="#">lldp timer tx-interval <i>interval</i></a>  |
| System view        | <a href="#">lldp hold-multiplier <i>value</i></a>   |
| System view        | <a href="#">lldp timer tx-delay <i>delay</i></a>  |
| System view        | <a href="#">lldp fast-count <i>count</i></a>  |
| System view        | <a href="#">lldp timer reinit-delay <i>timer</i></a>  |
| System view        | <a href="#">lldp tlv-enable basic-tlv { all   system-capability   system-description   system-name   port-description   management-address }</a>    |
|                    | <a href="#">no lldp tlv-enable basic-tlv { all   system-capability   system-description   system-name   port-description   management-address }</a> |
| Any view           | <a href="#">show lldp neighbor-information</a>  |
| Any view           | <a href="#">show lldp statistics</a>  |
| Any view           | <a href="#">show lldp status</a>  |
| Any view           | <a href="#">show lldp tlv-config</a>  |

## lldp

### Syntax

```
lldp
no lldp
```

### View

System view or Ethernet port view

### Parameters

None

### Description

It is used to enable or disable the global LLDP or port LLDP. If you want to enable port LLDP, you need to enable the global LLDP first. By default, LLDP is disabled globally; but when the global LLDP is enabled, the port LLDP is enabled by default.

### Examples

```
XS# lldp
Set successfully!
XS# interface ethernet 0/1
XS(Ethernet0/1)# lldp
Set successfully!
```

## Ildp admin-status

### Syntax

```
lldp admin-status { disable | rx | tx | rxtx }
```

### View

Ethernet port view

### Parameters

**disable**: A port in this mode does not send or receive LLDPDUs.  
**rx**: A port in this mode only receives LLDPDUs.  
**tx**: A port in this mode only sends LLDPDUs.  
**rxtx**: A port in this mode sends and receives LLDPDUs.

### Description

Set the LLDP operating mode.

### Examples

```
XS(Ethernet0/1)# lldp admin-status rxtx
Set successfully!
```

## Ildp encapsulation

### Syntax

```
lldp encapsulation { snap | Ethernet-ii }
```

### View

Ethernet port view

### Parameters

**snap, ethernet-ii**: The encapsulation format. It is the Ethernet II encapsulation format by default.

### Description

Configure the encapsulation format for LLDPDUs.

### Examples

```
XS(Ethernet0/1)# lldp encapsulation ethernet-ii
Set successfully!
```

## Ildp timer tx-interval

### Syntax

**Ildp timer tx-interval** *interval*

### View

System view

### Parameters

*interval*: Required, between 5 to 32768 seconds, 30 seconds by default.

### Description

Set the interval to send LLDPDUs.

### Examples

```
XS# Ildp timer tx-interval 50
Set successfully!
```

## Ildp timer tx-delay

### Syntax

**Ildp timer tx-delay** *delay*

### View

System view

### Parameters

*delay*: Required, between 1 to 8192 seconds, 2 seconds by default.

### Description

Set the delay period to send LLDPDUs.

### Examples

```
XS# Ildp timer tx-delay 6
Set successfully!
```

## Ildp timer reinit-delay

### Syntax

**Ildp timer reinit-delay** *timer*

### View

System view

### Parameters

*timer*: Required, between 1 to 10 seconds, 2 seconds by default.

#### Description

Set the initialization delay period.

#### Examples

```
XS# lldp timer reinit-delay 3
Set successfully!
```

## Ildp hold-multiplier

#### Syntax

```
lldp hold-multiplier value
```

#### View

System view

#### Parameters

*Value*: Required, range between 1 to 10, 5 by default.

#### Description

Set the TTL multiplier.

#### Examples

```
XS# lldp hold-multiplier 5
Set successfully!
```

## Ildp fast-count

#### Syntax

```
lldp fast-count count
```

#### View

System view

#### Parameters

*count*: Required, between 1 to 10, 3 by default.

#### Description

Set the number of LLDPDUs to be sent successively when a new neighboring device is detected.

#### Examples

```
XS# lldp fast-count 3
Set successfully!
```

## Ildp tlv-enable basic-tlv

### Syntax

```
lldp tlv-enable basic-tlv { all | system-capability | system-description |  
system-name | port-description | management-address}  
no lldp tlv-enable basic-tlv { all | system-capability | system-description |  
system-name | port-description | management-address}
```

### View

System view

### Parameters

**all**: All basic LLDP TLVs, including End of LLDPDU TLV, Chassis ID TLV, Port ID TLV, Time To Live TLV, Time To Live TLV, Port Description TLV, System Name TLV, System Description TLV, System Capabilities TLV, and Management Address TLV. And End of LLDPDU TLV, Chassis ID TLV, Port ID TLV, Time To Live TLV and Time To Live TLV are required.

**system-capability**: System Capabilities TLV.

**system-description**: System Description TLV.

**system-name**: System Name TLV.

**port-description**: Port Description TLV.

**management-address**: Management Address TLV.

### Description

Enable or disable LLDP TLV sending for specific types of LLDP TLVs.

### Examples

```
XS# lldp tlv-enable basic-tlv all  
Set successfully!
```

## show lldp neighbor-information

### Syntax

```
show lldp neighbor-information
```

### View

Any view

### Parameters

None

### Description

Display the information contained in the LLDP TLVs received through a port.

### Examples

```
XS# show lldp neighbor-information
```

## show lldp statistics

### Syntax

**show lldp statistics**

**View**

Any view

**Parameters**

None

**Description**

Display the LLDP statistics.

**Examples**

```
XS# show lldp statistics
Ethernet0/1
  Transmit Frames           : 0
  Receive Frames           : 0
  Receive Error Frames     : 0
  Discarded Frames         : 0
  TLVs Discarded Packets   : 0
  TLVs Unrecognized Packets : 0
  Org. TLVs Discarded Packets : 0
  Aged Out Packets         : 0
```

**show lldp status**

**Syntax**

**show lldp status**

**View**

Any view

**Parameters**

None

**Description**

Display the LLDP status.

**Examples**

```
XS# show lldp status
Global status of LLDP: Enable
Transmit interval : 50s
Hold multiplier   : 5
Reinit delay     : 3s
Transmit delay   : 6s
Fast start times  : 3
```

Port LLDP status:

| Port        | PortStatus | AdminStatus | Encapsulation |
|-------------|------------|-------------|---------------|
| Ethernet0/1 | Disable    | Rx&Tx       | Ethernet-II   |
| Ethernet0/2 | Enable     | Disable     | Ethernet-II   |
| Ethernet0/3 | Enable     | Disable     | Ethernet-II   |

|             |        |         |             |
|-------------|--------|---------|-------------|
| Ethernet0/4 | Enable | Disable | Ethernet-II |
| Ethernet0/5 | Enable | Disable | Ethernet-II |
| Ethernet0/6 | Enable | Disable | Ethernet-II |

## show lldp tlv-config

### Syntax

**show lldp tlv-config**

### View

Any view

### Parameters

None

### Description

Display the types of the LLDP TLVs that are currently sent.

### Examples

```
XS# show lldp tlv-config
Basic (optional) TLV:
  Port description      : YES
  System name          : YES
  System description   : YES
  System capability    : YES
  Management address   : YES
```

## 3.23 ACL Configuration Commands

The “Any view” in the below table refers to anyone of the following: System view, Ethernet port view, Port-based VLAN view, VLAN view, or dot1x view.

### Command list:

| View               | command  |
|--------------------|--|
| System view        | <a href="#"><b>acl number</b> <i>acl-number</i></a><br><a href="#"><b>no acl number</b> { <i>acl-number</i>   <b>all</b> }</a>   |
| ACL view           | <a href="#"><b>rule</b> <i>rule-id</i> { <b>permit</b>   <b>deny</b> } <i>rule-string</i></a><br><a href="#"><b>no rule</b> { <i>rule-id</i>   <b>all</b> }</a>          |
| Ethernet port view | <a href="#"><b>packet-filter</b> <i>acl-number</i> <i>acl-number</i></a><br><a href="#"><b>no packet-filter</b> <i>acl-number</i> { <i>acl-number</i>   <b>all</b> }</a> |
| Any view           | <a href="#"><b>show acl number</b> [<i>acl-number</i>]</a>   |

## acl number

### Syntax

**acl number** *acl-number*  
**no acl number** { *acl-number* | **all** }

### View

System view

### Parameters

*acl-number*: Required, between 1 to 30  
**all**: All the ACL number.

### Description

Use **acl number** *acl-number* command to create an ACL and enter the ACL view.  
 Use **no acl number** {*acl-number* | **all**} command to delete an ACL or all.

Note that the number from 1 to 10 is for basic ACL, the number from 11 to 20 is for advanced ACL, and the number from 21 to 30 is for L2 ACL.

### Examples

```
XS# acl number 3
XS(ACL-basic-3)#
```

## rule

### Syntax

```
rule rule-id {permit| deny} rule-string
no rule {rule-id| all}
```

### View

ACL view

### Parameters

*rule-id*: Required, between 1 to 10.  
**permit, deny**: specifies whether the rule is to permit or deny access.  
*rule-string*: ACL rule string. The string format varies with the type of ACL. For example, for basic ACL, the valid rule string is "**source-ip** *ip-address netmask*"; for advanced ACL, the valid rule string is "**source-ip** *ip-address netmask* [**source-port** *port-number* ] **destination** *ip-address netmask* [**destination-port** *port-number* ]"; for L2 ACL, the valid rule string is "**source-mac** *mac-address mac-address-mask* **destination** *mac-address mac-address-mask*".  
**all**: the command is applied to all the rule IDs.

### Description

Use **rule** *rule-id* {**permit**| **deny**} *rule-string* command to define an ACL rule.  
 Use **no rule** {*rule-id*| **all**} command to delete a specific rule or all rules of this ACL.

### Examples

```
XS# acl number 2
XS(ACL-basic-2)# rule 1 permit source-ip 192.168.0.111 255.255.255.0
Configure successfully!
```

## packet-filter acl-number

### Syntax

**packet-filter acl-number** *acl-number*  
**no packet-filter acl-number** {*acl-number*| **all**}

#### View

Ethernet port view

#### Parameters

*acl-number*: Required, between 1 to 30.  
**all**: the comand is applied to all the ACLs.

#### Description

Use **packet-filter acl-number** *acl-number* command to apply an ACL to a specific port.  
 Use **no packet-filter acl-number** {*acl-number*| **all**} command to unbind an ACL from a specific port.

#### Examples

```
XS(Ethernet0/1)# packet-filter acl-number 2
Configuration has been completed successfully!
XS(Ethernet0/1)# no packet-filter acl-number 2
Delete acl binding port successfully!
```

## show acl number

#### Syntax

**show acl number** [*acl-number*]

#### View

Any view

#### Parameters

*acl-number*: Optional, between 1 to 30

#### Description

Use **show acl number** command to display valid ACL number;  
 Use **show acl number** *acl-number* to display the rules associated to this ACL number.

#### Examples

```
XS# show acl number 2
Basic ACL 2:
rule 01 permit source 192.168.0.111 255.255.255.0
```

## 3.24 Port Binding Configuration Commands

The "Any view" in the below table refers to anyone of the following: System view, Ethernet port view, Port-based VLAN view, VLAN view, or dot1x view.

#### Command list:

| View            | command  |
|-----------------|--|
| System view     | <b>ip-binding</b>  |
| Ip-binding view | <b>user-bind mac-addr mac ip-addr ip ethernet ethernet-port</b><br><b>no user-bind { all  ethernet ethernet-port  mac-addr mac ip-addr ip ethernet ethernet-port }</b> |
| Any view        | <b>show ip-binding</b>   |

## ip-binding

### Syntax

**ip-binding**

### View

System view

### Parameters

None

### Description

Use **ip-binding** to enter the ip-binding view, then you can use the port binding commands.

### Examples

```
XS# ip-binding
XS(ip-binding)#
```

## user-bind

### Syntax

**user-bind mac-addr mac ip-addr ip ethernet ethernet-port**  
**no user-bind { all| ethernet ethernet-port| mac-addr mac ip-addr ip ethernet ethernet-port }**

### View

Ip-binding view

### Parameters

*mac*: MAC address, in the format xx-xx-xx-xx-xx-xx.  
*ip*: IP address, in the format x.x.x.x, with x no larger than 255.  
*ethernet-port*: The ethernet port to which the MAC address and IP address are bound.  
**all**: to clear all port binding commands of all ports

### Description

Use **user-bind mac-addr mac ip-addr ip ethernet ethernet-port** command to bind the MAC address and IP address to a specific port. By default, no user MAC address or IP address is bound to a port.  
Use **no user-bind all** command to clear all the port binding commands of all the

ports.  
 Use **no user-bind ethernet** *ethernet-port* command to clear all the port binding commands of a specific port.  
 Use **no user-bind mac-addr** *mac ip-addr ip* **ethernet** *ethernet-port* command to clear a specific port binding command.

**Examples**

```
XS(ip-binding)# no user-bind all
Set successfully!
```

**show ip-binding**

**Syntax**

**show ip-binding**

**View**

Any view

**Parameters**

None

**Description**

Use **show ip-binding** command to display the ip-binding information.

**Examples**

```
XS# show ip-binding
ip-binding information:
No configuration...
```

### 3.25 MVR configuration commands

The “Any view” in the below table refers to anyone of the following: System view, Ethernet port view, Port-based VLAN view, VLAN view, or dot1x view.

**Command list:**

| View        | command   |
|-------------|---|
| System view | <a href="#">mvr</a><br><a href="#">no mvr</a>   |
| System view | <a href="#">mvr group</a> <i>mvr-group</i><br><a href="#">no mvr group</a> <i>mvr-group</i>   |
| System view | <a href="#">mvr port type</a> <i>{receiver source none}</i> <b>ethernet</b><br><a href="#">ethernet-port</a> <b>[ to ethernet</b> <i>ethernet-port</i> <b>]</b> |
| System view | <a href="#">mvr mode</a> <i>{dynamic compatible}</i>  |
| System View | <a href="#">mVlanId</a> <i>vlan-id</i>  |
| Any view    | <a href="#">show configuration</a>  |
| Any view    | <a href="#">show group</a>  |
| Any view    | <a href="#">show port</a>   |

## **mvr**

### Syntax

**mvr**

### View

System view

### Parameters

None

### Description

Use **mvr** to enable global mvr.  
Use **no mvr** to disable global mvr.

### Examples

```
XS# mvr
Enable mvr
```

## **mvr group**

### Syntax

```
mvr group mvr-group
no mvr group mvr-group
```

### View

System view

### Parameters

*mvr-group*: a multicast IP address

### Description

Use **mvr group** to configure an IP multicast address statically.  
Use **no mvr group** to delete an IP multicast address.

### Examples

```
XS# mvr group 225.1.1.2
Groups of mvr set to 225.1.1.2
```

## **mvr port type**

### Syntax

```
mvr port type {receiver|source|none} ethernet ethernet-port [ to ethernet ethernet-port ]
```

### View

System view

### Parameters

*source*: set uplink ports that receive and send multicast data as source ports.  
*receiver*: set a port as a receiver port if it is a subscriber port and should only receive multicast data. It does not receive data unless it becomes a member of the multicast group, either statically or by using IGMP leave and join messages.  
*none*: remove the *source* or *receiver* port from the multicast VLAN.  
*ethernet-port*: ethernet port, in the form of *interface* = { *interface-type*/*interface-number* }, *interface-type* = {0 | 1}, when *interface-type* is 0, *interface-number* = { 1 | 2 | ... | 24 }, when *interface-type* is 1, *interface-number* = { 1 | 2 }.

### Description

Use **mvr port type** to configure a source or receiver port for multicast VLAN or remove them from the multicast VLAN.

### Examples

```
XS# mvr port type receiver ethernet 0/3 to ethernet 0/5
The configuration is successful.
```

## mvr mode

### Syntax

```
mvr mode {dynamic|compatible}
```

### View

System view

### Parameters

*compatible* mode: multicast data received by MVR hosts is forwarded to all MVR data ports, regardless of MVR host membership on those ports. The multicast data is forwarded only to those receiver ports that MVR hosts have joined, either by IGMP reports or by MVR static configuration. IGMP reports received from MVR hosts are never forwarded from MVR data ports that were configured in the switch.

*dynamic* mode: multicast data received by MVR hosts on the switch is forwarded from only those MVR data and client ports that the MVR hosts have joined, either by IGMP reports or by MVR static configuration. Any IGMP reports received from MVR hosts are also forwarded from all the MVR data ports in the switch. This eliminates the use of unnecessary bandwidth on MVR data port links, which occurs when the switch runs in compatible mode.

### Description

Use **mvr mode** to specify a mode for the mvr.  
The default mode is dynamic.

### Examples

```
XS# mvr mode dynamic
mode of mvr set to dynamic
```

## mvr mVlan

### Syntax

**mVlanId** *vlan-id*

### View

System view

### Parameters

*vlan-id*: a VLAN ID in the range of 2 to 4094.

### Description

Use **mvr mVlanId** to set the multicast VLAN ID to transmit data and igmp-snooping packets.

### Examples

```
XS# mvr mVlanId 200
multicast vlan id of mvr set to 200
```

## show mvr configuration

### Syntax

**show mvr configuration**

### View

Any view

### Parameters

None

### Description

Display the basic configuration of mvr.

### Examples

```
XS# show mvr configuration
show mvr configuration

MVR Global state      : Enabled
Multicast Vlan Id    : 200
Mode                  : dynamic
```

## show mvr group

### Syntax

**show mvr group**

### View

Any view

**Parameters**

None

**Description**

Display all multicast IP address groups.

**Examples**

```
XS# show mvr group
Vlan ID           : 200
Multicast group   : 225.1.1.2
Vlan ID           : 200
Multicast group   : 226.1.1.2
```

**show mvr port**

**Syntax**

**show mvr port**

**View**

Any view

**Parameters**

None

**Description**

Display the "source", "receive", and "none mvr" ports.

**Examples**

```
XS# show mvr port
source ports:
Ethernet0/5 Ethernet0/7
receiver ports:
Ethernet0/9 Ethernet0/10
None mvr ports:
Ethernet0/1 Ethernet0/2 Ethernet0/3
Ethernet0/4 Ethernet0/6 Ethernet0/8
Ethernet0/11 Ethernet0/12 Ethernet0/13
Ethernet0/14 Ethernet0/15 Ethernet0/16
Ethernet0/17 Ethernet0/18 Ethernet0/19
Ethernet0/20 Ethernet0/21 Ethernet0/22
Ethernet0/23 Ethernet0/24 Ethernet1/25
Ethernet1/26 Ethernet1/27 Ethernet1/28
```

## 3.26 Loopback-detection

**Command list**

| View                               | command   |
|------------------------------------|---|
| System view and Ethernet port view | <a href="#">loopback-detection</a><br><a href="#">no loopback-detection</a> |

|                    |   |
|--------------------|---|
| System view        | <a href="#">loopback-detection interval-time</a><br><a href="#">no loopback-detection interval-time</a> |
| Ethernet port view | <a href="#">loopback-detection control</a><br><a href="#">no loopback-detection control</a>             |
| Any view           | <a href="#">show loopback-detection</a>   |

## loopback-detection

### Syntax

**loopback-detection**  
**no loopback-detection**

### View

System view and Ethernet port view

### Parameters

None

### Description

Use the **loopback-detection** command to enable loopback detection globally or on a specified port.

Use the **no loopback-detection** command to disable loopback detection globally or on a specified port.

### Examples

```
XS# loopback-detection
Enable loopback detection successfully
```

## loopback-detection interval-time

### Syntax

**loopback-detection interval-time** *second*  
**no loopback-detection interval-time**

### View

System view

### Parameters

*second*: time interval for loopback detection, in the range of 5 to 300 (seconds). It defaults to 30 seconds.

### Description

Use the **loopback-detection interval-time** command to set time interval for loopback detection.

Use the **no loopback-detection interval-time** command to restore to the default time interval.

### Examples

```
XS# loopback-detection interval-time 50
```

Set successfully

## loopback-detection control

### Syntax

**loopback-detection control**  
**no loopback-detection control**

### View

Ethernet port view

### Parameters

None

### Description

Use the **loopback-detection control** command to enable loopback-detection control on a specific port.

Use the **no loopback-detection control** command to disable loopback-detection control on a specific port.

### Examples

```
XS(Ethernet0/2)# loopback-detection control
Enable loopback detection control on this port successfully.
```

## show loopback-detection

### Syntax

**show loopback-detection**

### View

Any view

### Parameters

None

### Description

Display loopback detection status on the global and on each port.

### Examples:

```
XS# show loopback-detection
```

Loopback detection is currently enabled on this switch!

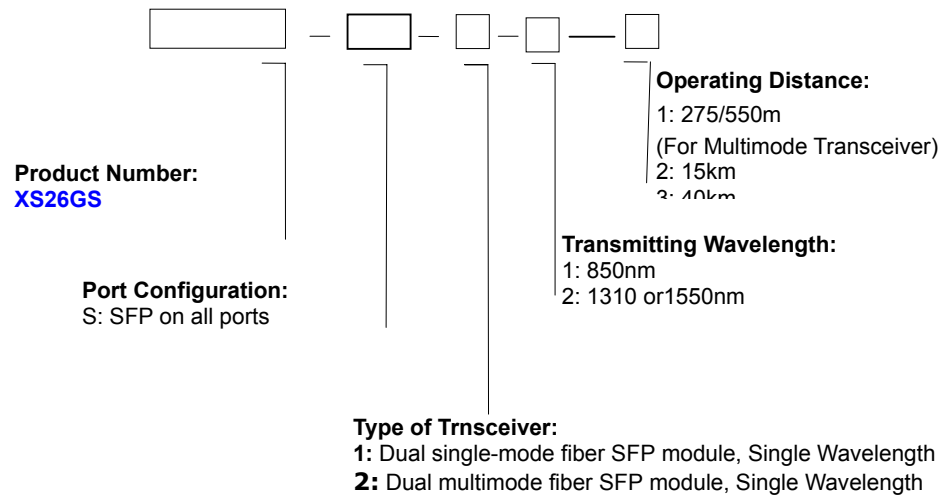

Interval Time(s): 30

| Ports       | LBD      | LBD Control |
|-------------|----------|-------------|
| Ethernet0/1 | Disabled | Disabled    |
| Ethernet0/2 | Disabled | Enabled     |
| Ethernet0/3 | Disabled | Disabled    |

|              |          |          |
|--------------|----------|----------|
| Ethernet0/4  | Disabled | Disabled |
| Ethernet0/5  | Disabled | Disabled |
| Ethernet0/6  | Disabled | Disabled |
| Ethernet0/7  | Disabled | Disabled |
| Ethernet0/8  | Disabled | Disabled |

## 6. Appendix B: Supported MIBs

This appendix lists the supported Management Information Base (MIBs) for this release of the XS26GS switch.

### **MIB list**

- RFC1213-MIB
- RFC1493-BRIDGE-MIB
- RFC1573-IF-MIB
- RFC1643-EtherLike-MIB
- RFC1757-RMON-MIB
- RFC2618-RADIUS-AUTH-CLIENT-MIB
- RFC2620-RADIUS-ACC-CLIENT-MIB
- RFC2674-P-BRIDGE-MIB
- RFC2674-Q-BRIDGE-MIB
- LLDP-MIB
- IEEE8021-PAE-MIB
- FMC-SWITCH-MIB
- FMC-IGMP-SNOOPING-MIB
- FMC-SWITCH-MAC-AUTHENTICATION-MIB
- FMC-SWITCH-RADIUS-MIB
- FMC-MSTP-MIB
- FMC-MVR-MIB
- RSTP-MIB
